1. Introduction

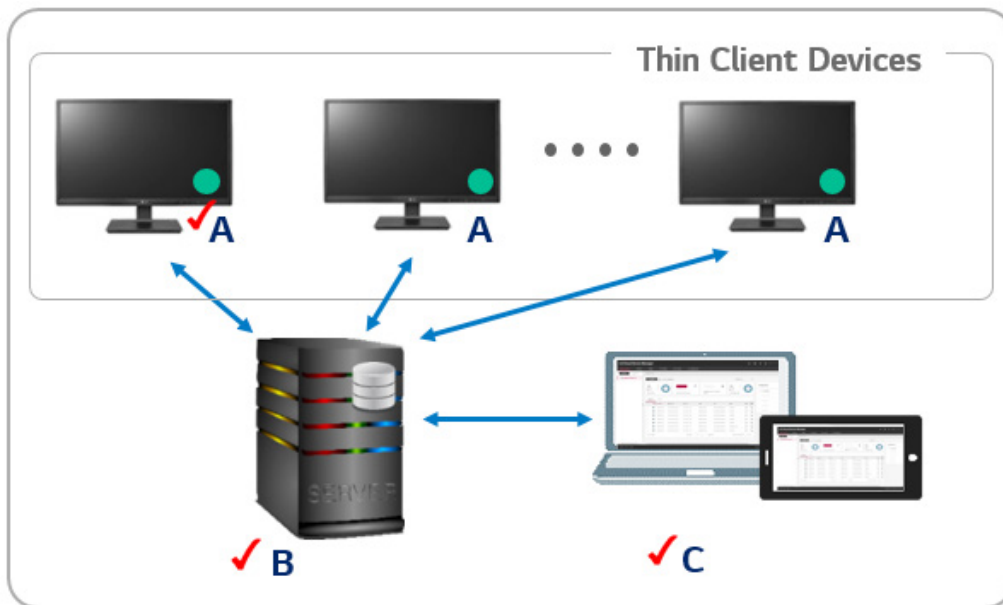

Introduction of [LG Cloud Device Manager]

[LG Cloud Device Manager] is the next-generation technology that systematically manages and monitors devices, helping you manage your business and tasks effectively.

Terms

Terms	Description
LG CDM	LG Cloud Device Manager
Device	A Thin Client product which is managed by LG CDM.
LG Cloud Agent	SW installed on the device, allowing communication with LG CDM
Smart Start	Configuration that cause the device to operate in kiosk mode
DNS(Domain Name System)	Servers that rename the host's domain to the host's network address or vice versa
DHCP(Dynamic Host Configuration Protocol)	Protocol that automatically provides clients with the IP address of the host and default settings for various TCP/IP protocols
SMTP(Simple Mail Transfer Protocol)	Protocol used to send e-mail on the Internet
IP(Internet Protocol)	Protocol that the sending and receiving hosts use to send and receive information on the packet-switched network
FQDN(Fully Qualified Domain Name)	Full domain name, including host name and domain name
P2P	peer-to-peer network
Group token	Allows the device to be turned on remotely via the network's Ethernet.
Profile	A bundle of pre-set values of device attributes
Template	A bundle of commands to execute on the device
Events	Records of actions processed within LG CDM
Task	A command that is given to the device from LG CDM
Heartbeat	System messages sent periodically when there are no queued messages.
Check in	Check that the settings on the device are the same as those specified in the CDM
Remote Repository	Remote File Storage
Cluster	Groups for synchronizing file stores
Wake On Lan	Allows the device to be turned on remotely via the network's Ethernet.
Shadowing(VNC)	Graphical desktop sharing system to control devices remotely
RDS(Remote Desktop Services)	Provide individual virtualized applications, secure mobile and remote desktop access
RDP(Remote Desktop Protocol)	A protocol for using a desktop computer remotely
UWF(Unified Write Filter)	A function to limit writing on the drive to protect it
AD(Active Directory)	Microsoft's proprietary directory service

LG CDM Diagram

- LG Cloud Agent (A): A client program that is installed on the device to carry out the commands received from the server
- LG CDM Server (B): A program that receives commands from the administrator and delivers such commands to the device
- LG CDM UI Console (C): A program for administrators to connect to the server and issue commands

System Specifications

LG CDM Server Installation Specifications

Category	Detailed Specifications
Processor	Quad core, 3.0 GHz CPU based system or above
RAM	8 GB (for 10,000 devices) or 16 GB (for 50,000 devices) or above
HDD	2 x 1 TB SAS HDD for RAID configuration
Ethernet	1/10 GBPS Ethernet port
OS	Windows Server 2016 or higher (x86_64)
Browser	<ul style="list-style-type: none">• Google Chrome: v. 28 or higher• Mozilla Firefox: v. 21 or higher• Apple Safari: v. 5.1.7 or higher (the Windows version of Safari is not supported)• Edge: v. 98 or higher

Remote Repository Installation Specifications

Category	Detailed Specifications
Processor	Quad core, 3.0 GHz CPU based system or above
RAM	8 GB or above
HDD	500 GB or above
Ethernet	1/10 GBPS Ethernet port
OS	Windows Server 2016 or higher(x86_64)

List of Supported Products

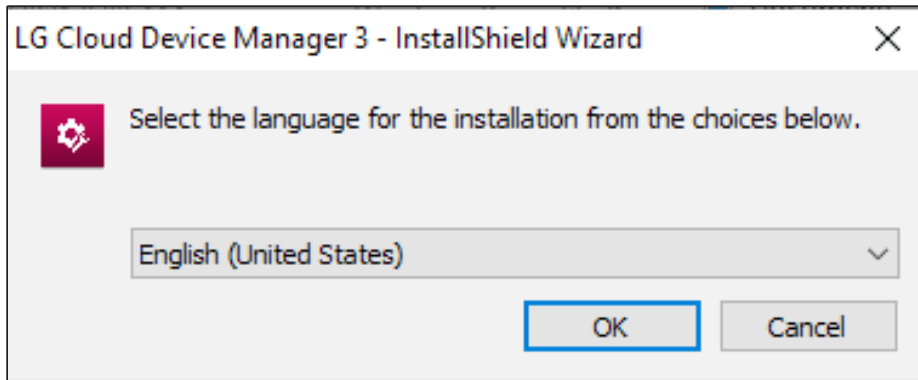

- 24CK550W
- CL600W
- 27CN650W
- 34CN650W
- 24CN650W
- 24CN670W
- 15ZT90P
- 14ZT90P
- CQ600W
- 24CQ650W
- 27CQ670W
- 24CR670W
- 14UT70Q
- 16UT70Q
- 17ZT90P

2. Software Installation Guide

LG Cloud Device Manager Installation

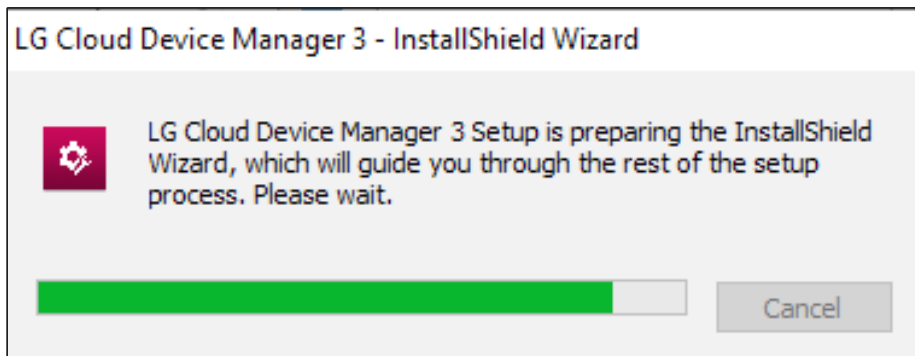

Upon initial installation (including deletion and reinstallation)

- 1 Run the installation file
 - Installation parameters such as Silent install, etc., are not supported.
- 2 Select installation language

- You can select 8 languages.
 - [Korean], [English (United States)], [Chinese] (Simplified), [Japanese], [German], [Spanish], [French], [Portuguese (Brazilian ABNT)]
- 3 Select a language and click the OK button.

Preparation stage

This is the preparation stage for installation after selecting the language. After a few seconds, it automatically proceeds to the next stage.

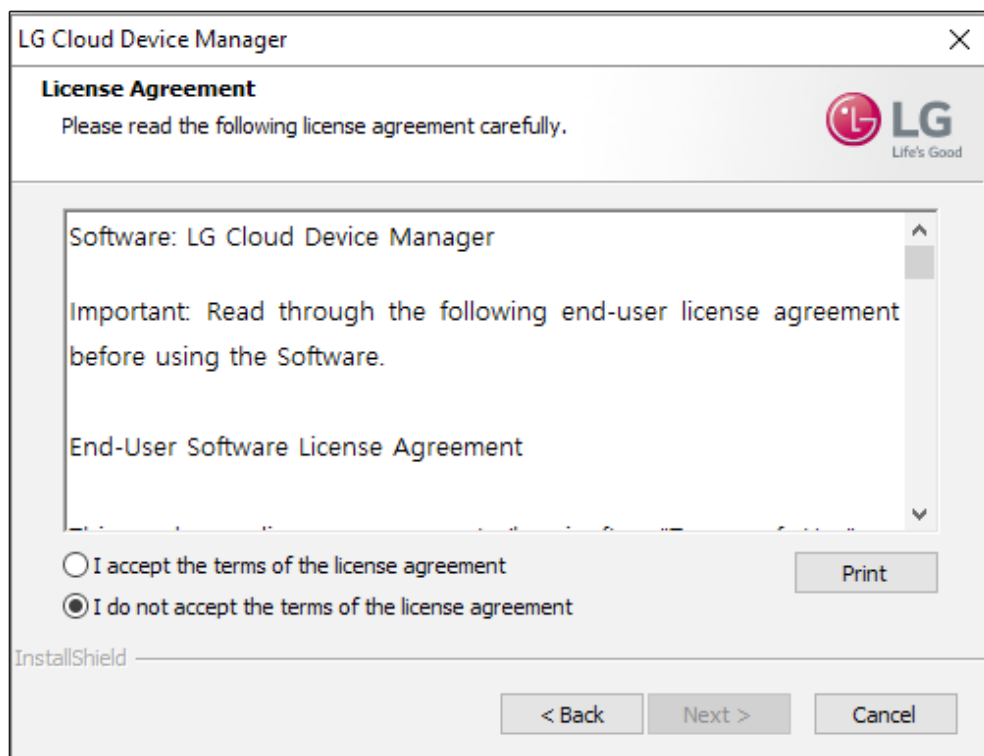

You can cancel the installation at this stage, and if canceled, the installer will move to the exit stage.

Welcome stage

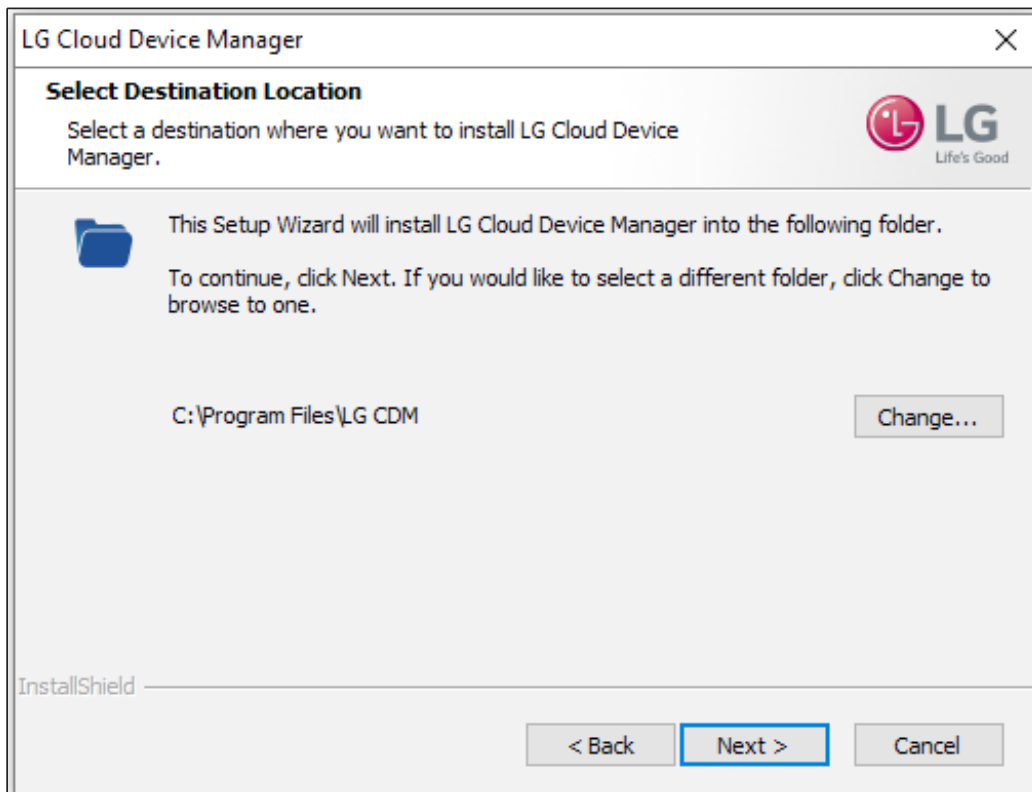

This is a welcome stage that checks the program name and whether you want to install it. Click the Next button to proceed to the next stage.

End user license agreement stage

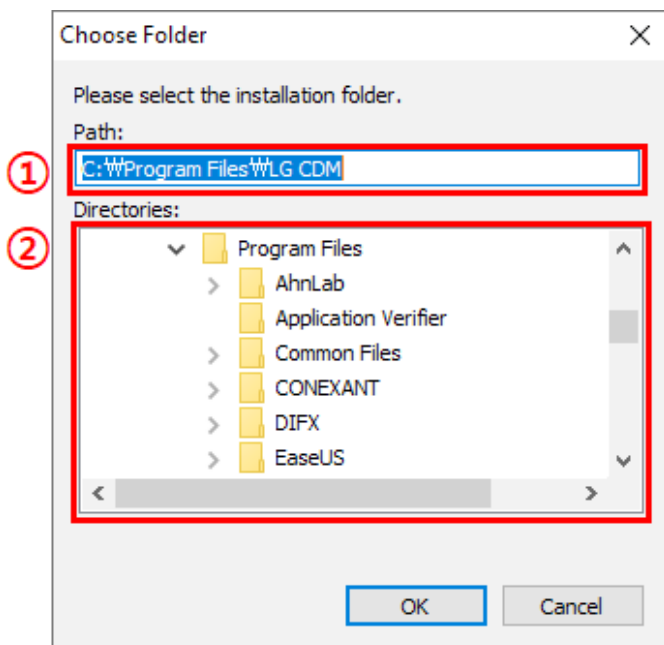

This stage asks you to agree to the LG CDM's license. If you do not agree to the terms and conditions, you cannot proceed to the next stage.

Select installation location

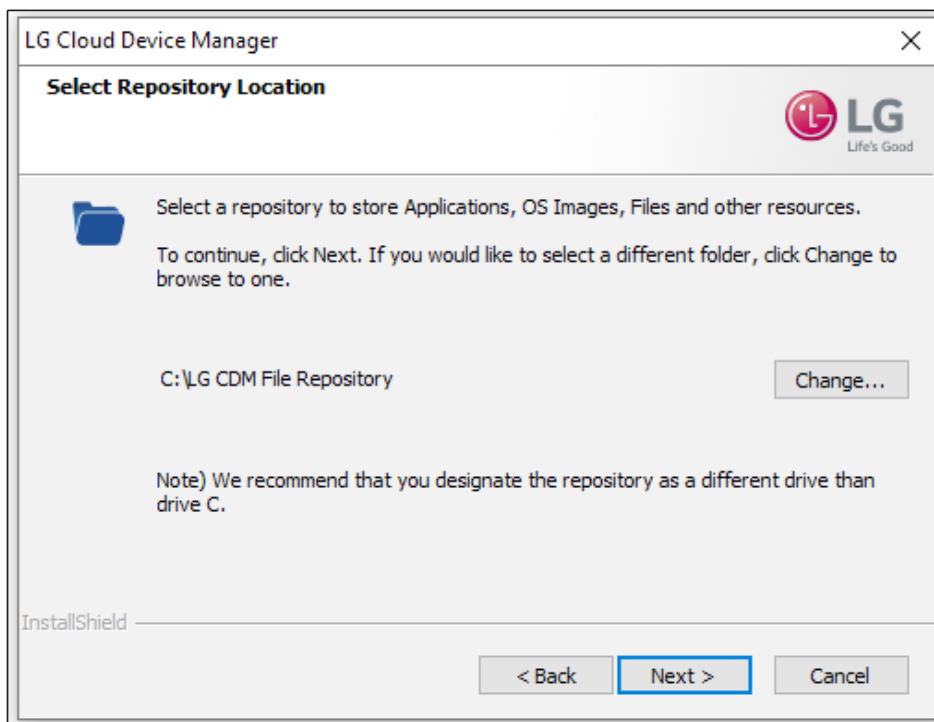

In this stage, you select the location where LG CDM will be installed.
The default setting for the installation path is C:\Program Files\LG CDM.

- How to change the installation path

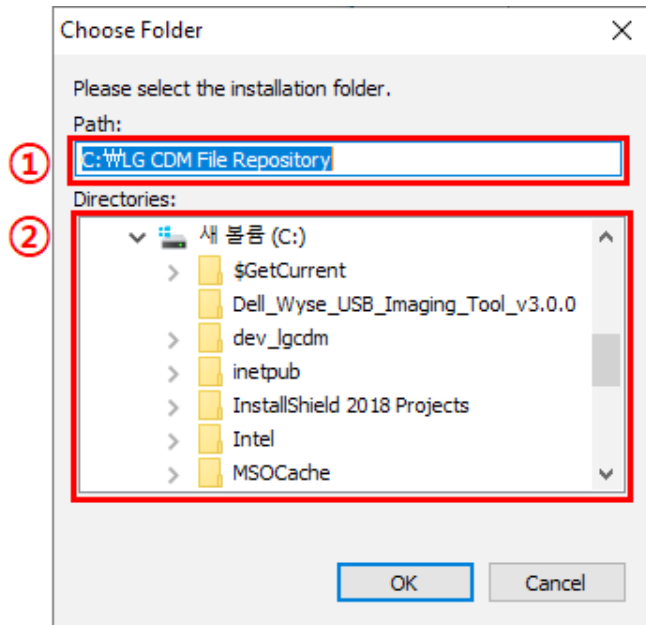

- There are two ways to change the path.
 - Enter the installation path directly in the path input box and click the OK button. If there is no folder in the specified path, the installer creates one.
Example) C:\LG CDM
 - In the tree structure at the bottom of the directory, select the desired folder for installation and click the OK button.

Select repository location

In this stage, you can choose a file repository location.
The default value of the repository path is C:\LG CDM File Repository.

- How to change the repository path

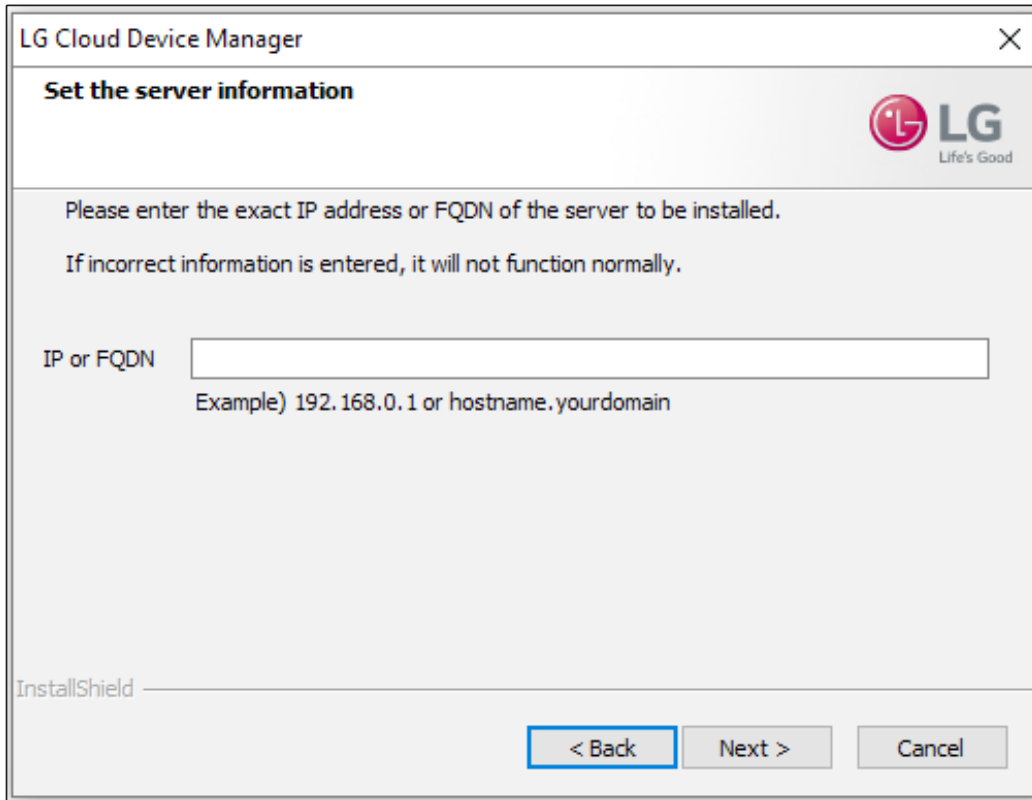

- There are two ways to change the path.
 - Enter the installation path directly in the path input box and click the OK button. If there is no folder in the specified path, the installer creates one.
Example) D:\WLG CDM File Repository
 - In the tree structure at the bottom of the directory, select the desired folder for installation and click the OK button.

NOTE

- The file repository is large since it contains the copied images, applications to be installed, files to be delivered to the device, etc., are stored. We **recommend selecting a drive other than the C drive** where the operating system is installed.
- If it is installed on the C drive, the system may not operate normally because the disk capacity is full.

Server information settings

The dialog box is titled "LG Cloud Device Manager" and has a close button (X) in the top right corner. Below the title bar, the text "Set the server information" is displayed. To the right of this text is the LG logo with the tagline "Life's Good".

Please enter the exact IP address or FQDN of the server to be installed.

If incorrect information is entered, it will not function normally.

IP or FQDN

Example) 192.168.0.1 or hostname.yourdomain

InstallShield

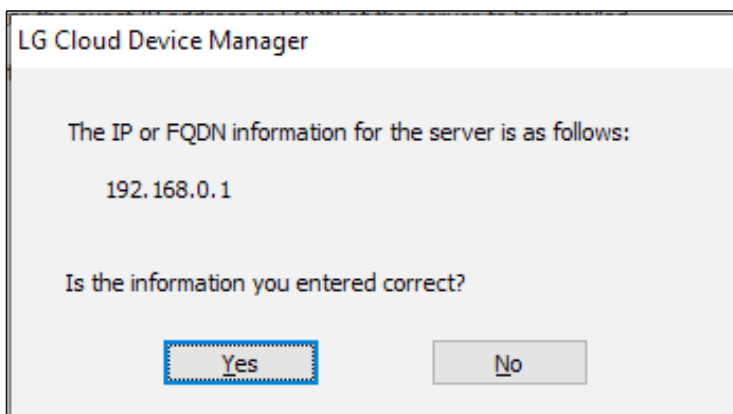

< Back Next > Cancel

This is the stage that you can enter the IP address or FQDN information of the server where LG CDM will be installed.

! NOTE

- It does not check whether the entered IP or FQDN is valid.
- **Even if incorrect information is entered (i.e., when IP/FQDN value is entered in the wrong format or it is different from the actual information), the installation is completed but the LG CDM will not operate normally.** Therefore, you must make sure that the information you entered is correct.

When you click the Next button, a pop-up will appear. Double-check that the information you entered is correct.

The dialog box is titled "LG Cloud Device Manager".

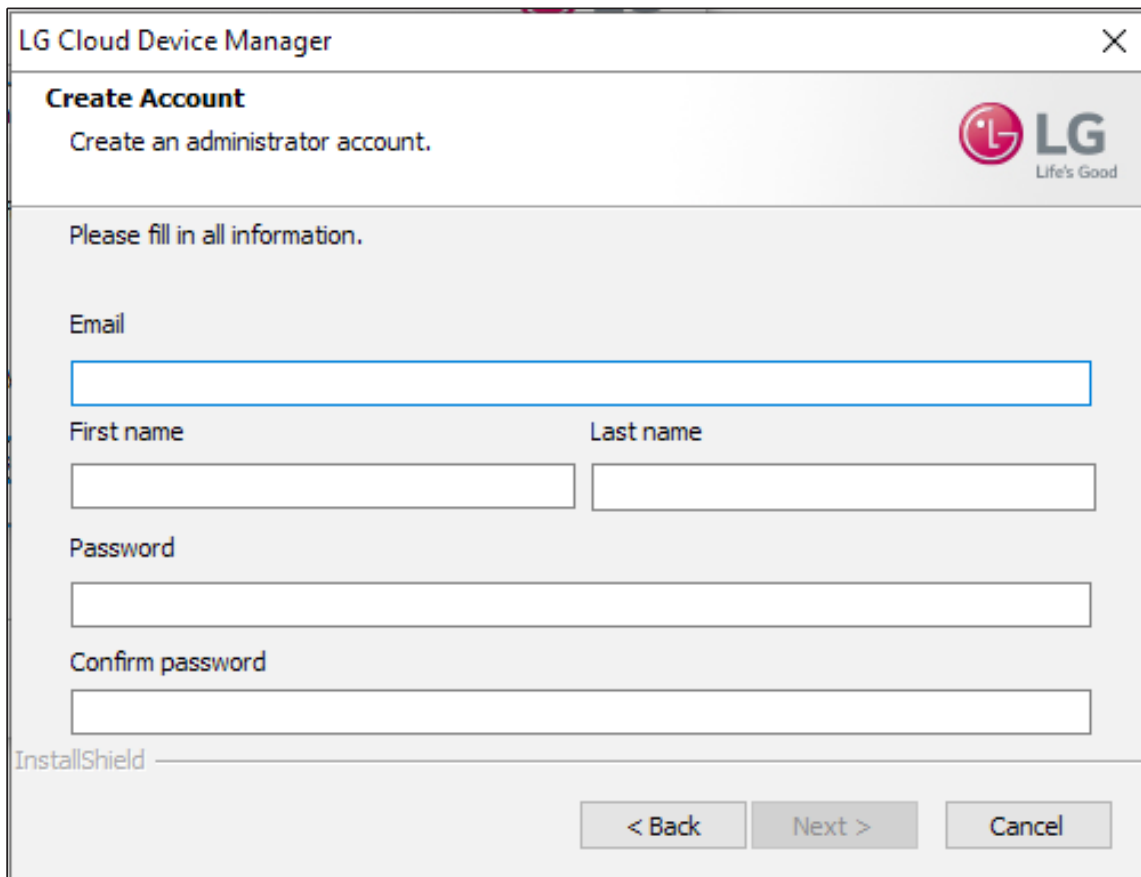

The IP or FQDN information for the server is as follows:

192.168.0.1

Is the information you entered correct?

Yes No

Create initial user account

The screenshot shows a window titled "LG Cloud Device Manager" with a close button in the top right corner. Inside the window, the title "Create Account" is displayed in bold, followed by the instruction "Create an administrator account." The LG logo with the tagline "Life's Good" is in the top right. Below this, a message says "Please fill in all information." There are four input fields: "Email" (a single wide field), "First name" and "Last name" (two side-by-side fields), "Password" (a single wide field), and "Confirm password" (a single wide field). At the bottom left is the "InstallShield" logo. At the bottom right are three buttons: "< Back", "Next >", and "Cancel".

At this stage, you can create an initial user account. The criteria for each input are as follows:

- [Email]:
 - Up to 50 characters
 - Must contain only one @ character
 - Must have at least one character in front of @
 - Must be separated by a dot after @
 - Must have one or more characters between @ and the dot
 - Must have one or more characters after the dot
 - Allowed characters: You can use only @0123456789-_.ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz
- [First name]: Up to 64 characters
- [Last name]: Up to 64 characters
- [Password]:
 - 10-50 characters
 - [Password] and [Confirm password] must match
 - Allowed characters: 0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz~!@#\$\$%^&*()_-=|{}[]<>.,/? can be used only

Database settings

LG Cloud Device Manager

Database setup
The information you enter is used for MongoDB and MariaDB.

MongoDB Database

Database name: TCMS
Username: lgcdm
Password:
Confirm password:

MariaDB Database

Database name: TCMS
Username: lgcdm
Password:
Confirm password:

InstallShield

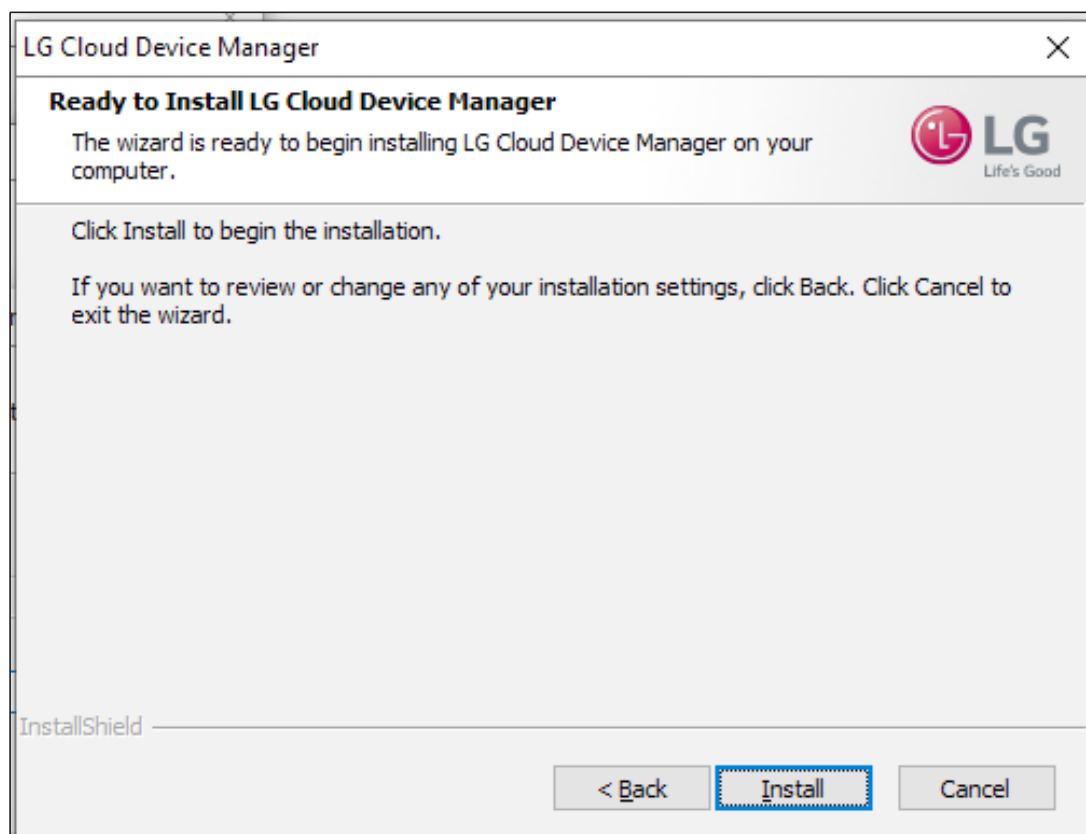

< Back Next > Cancel

This is the stage that you can see the information of the database (MongoDB, MariaDB) used by LG CDM ([Database Name], [User Name]) and set the [Password].

The criteria for [Password] are as follows:

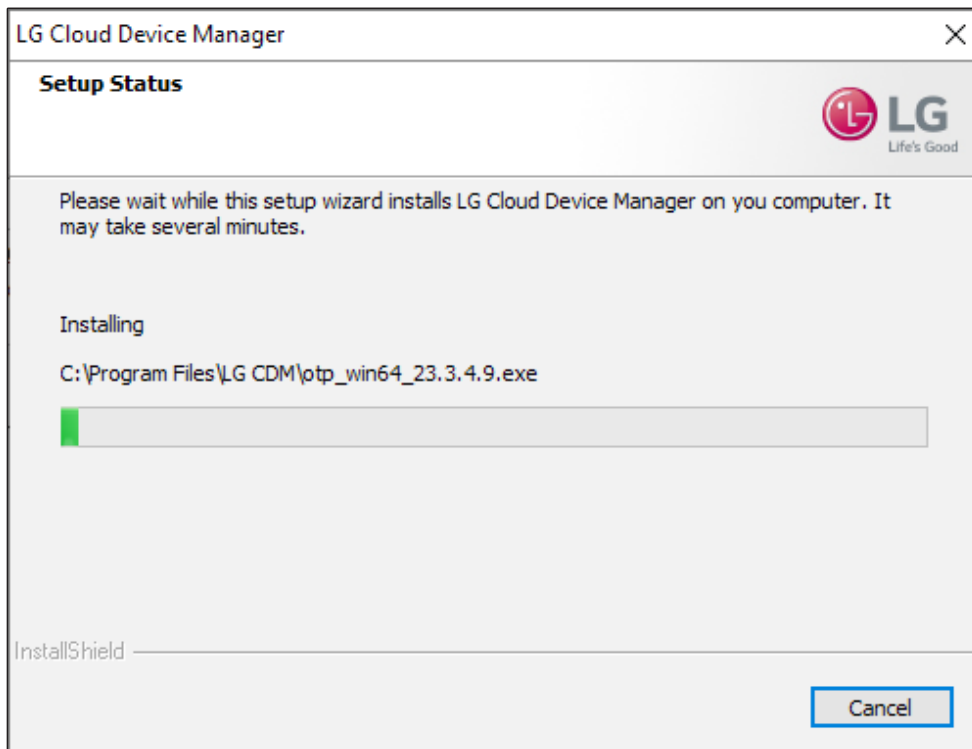

- Length of the password: 8 to 31 characters
- A password must contain lowercase letters (a to z), uppercase letters (A to Z), and numbers (0 to 9) in English.
- Quotation marks ('), double quotation marks ("), backslashes (\), and space () cannot be used in the password.

Installation preparation stage

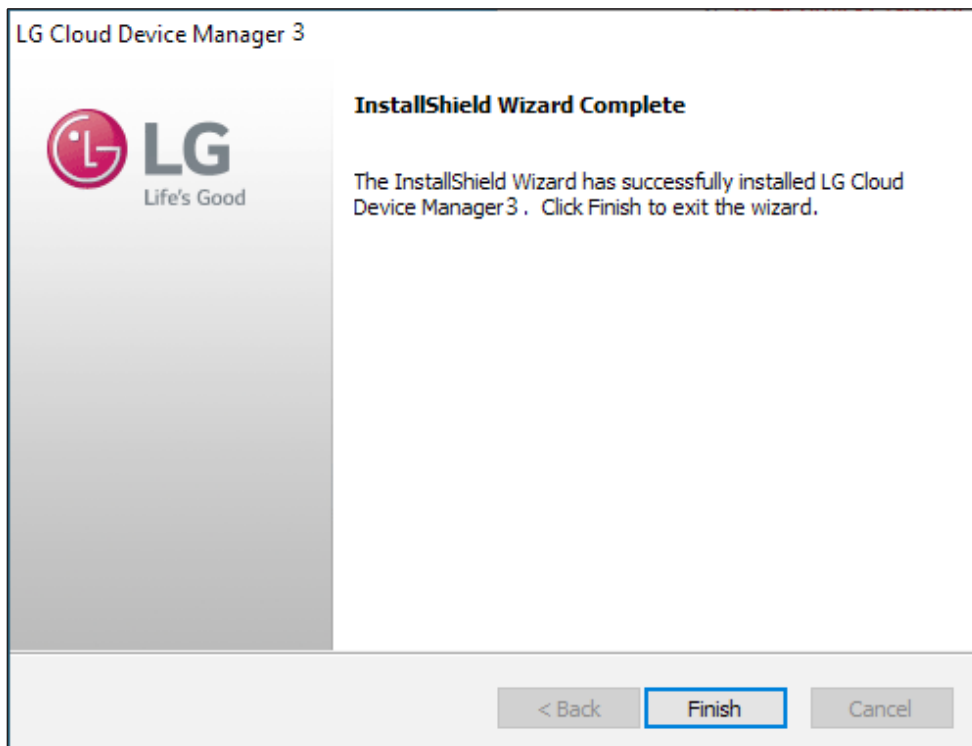

This stage asks if you want to install the program. If you want to edit the previously set information, click the Back button to go to the previous stage, and if you want to proceed with the installation, click the Install button to go to the next stage.

Installation stage

At this stage, you can copy the files/folders to be installed, and install the program (Erlang/VS Redistributable Package) that requires pre-installation to operate LG CDM. Register and control system environment settings and various services (Tomcat/MariaDB/MongoDB/RabbitMQ). It usually takes 5 to 10 minutes, but the time may vary depending on the performance of the PC.

This stage informs you that the installation is complete. Click the Completed button to exit the installation file.

For LG CDM Update

To update LG CDM without deleting the old version from the system, simply run LG CDM 3.1 installer executable. The Installer Update feature allows for an easier transfer of the database, including LG CDM user and device information from the old version.

• LG CDM Installer Update Support Table

From \ To	2.09.25 (2.1 MR)	3.00.12 (3.0)	3.00.56 (3.0 MR)	3.01.17 (3.1)	3.01.53 (3.1 MR)
2.07.01 (2.0)	O	X	X	X	X
2.08.18+ (2.1)	X	O	O	X	X
2.09.22+ (2.1 MR)	X	O	O	X	X
3.00.12 (3.0)	X	O (Data Restore)	O (Data Restore)	O	O
3.00.56+ (3.0 MR)	X	X	O (Data Restore)	O	O
3.01.00+ (3.1)	X	X	X	O (Data Restore)	O (Data Restore)
3.01.53 (3.1 MR)	X	X	X	X	O (Data Restore)

• Steps to update LG CDM

1. (Recommended) Before running LG CDM 3.1 installer executable, stop following services.

A. Services to stop:

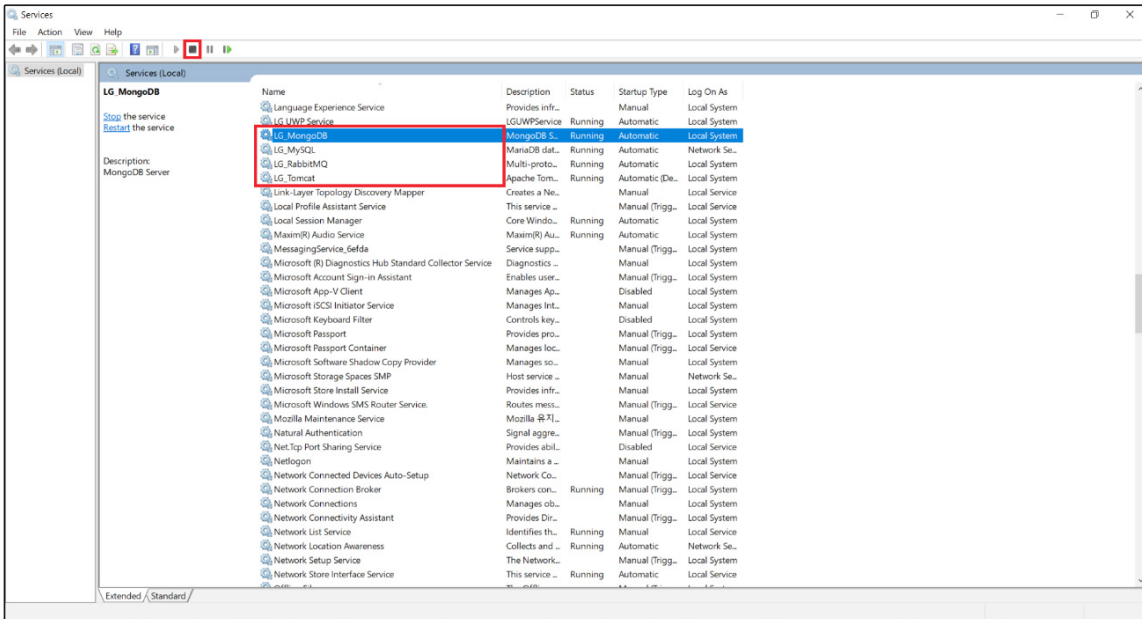

- i. LG_MongoDB
- ii. LG_MySQL
- iii. LG_RabbitMQ
- iv. LG_Tomcat

B. Method 1 – Windows Command Prompt (cmd.exe)

- i. Run cmd.exe as administrator
- ii. Use commands below to stop the services:
 - sc stop LG_MongoDB | sc stop LG_MySQL | sc stop LG_RabbitMQ | sc stop LG_Tomcat

C. Method 2 – Windows Services (See the figure below)

- i. Open Windows Services through Windows Run > services.msc
- ii. In Services, select and stop each services manually.

2. Run the new LG CDM 3.1 installer executable without deleting the old CDM to proceed with the LG CDM update.
LG CDM Installer will automatically backup the database from the old LG CDM and restore it to the new version.
Note, [Task Management] > [Summary] / [Detail] history will be lost.

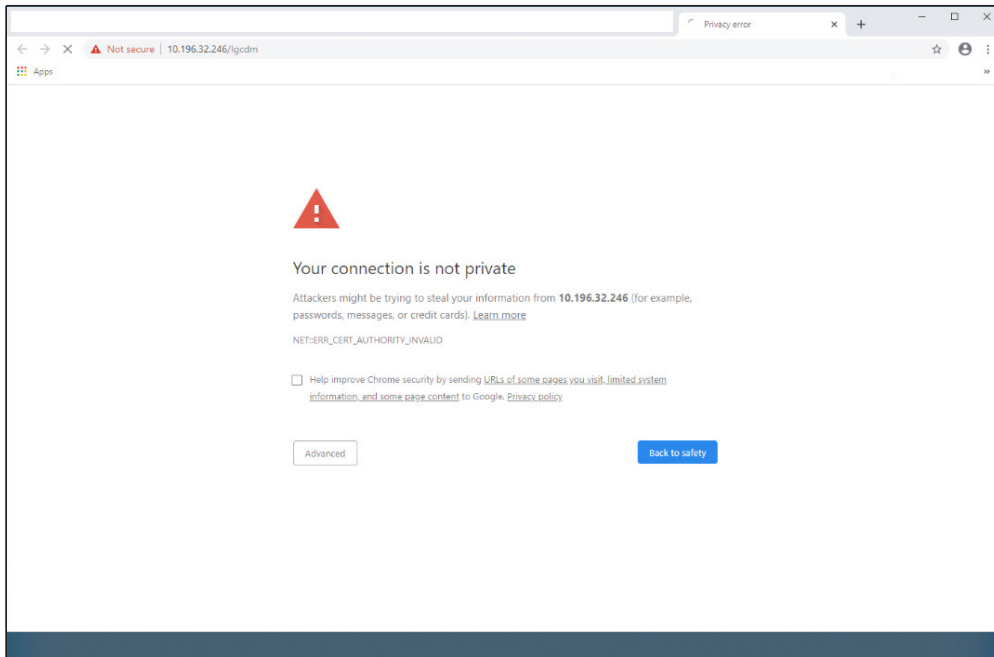

Connect to LG CDM

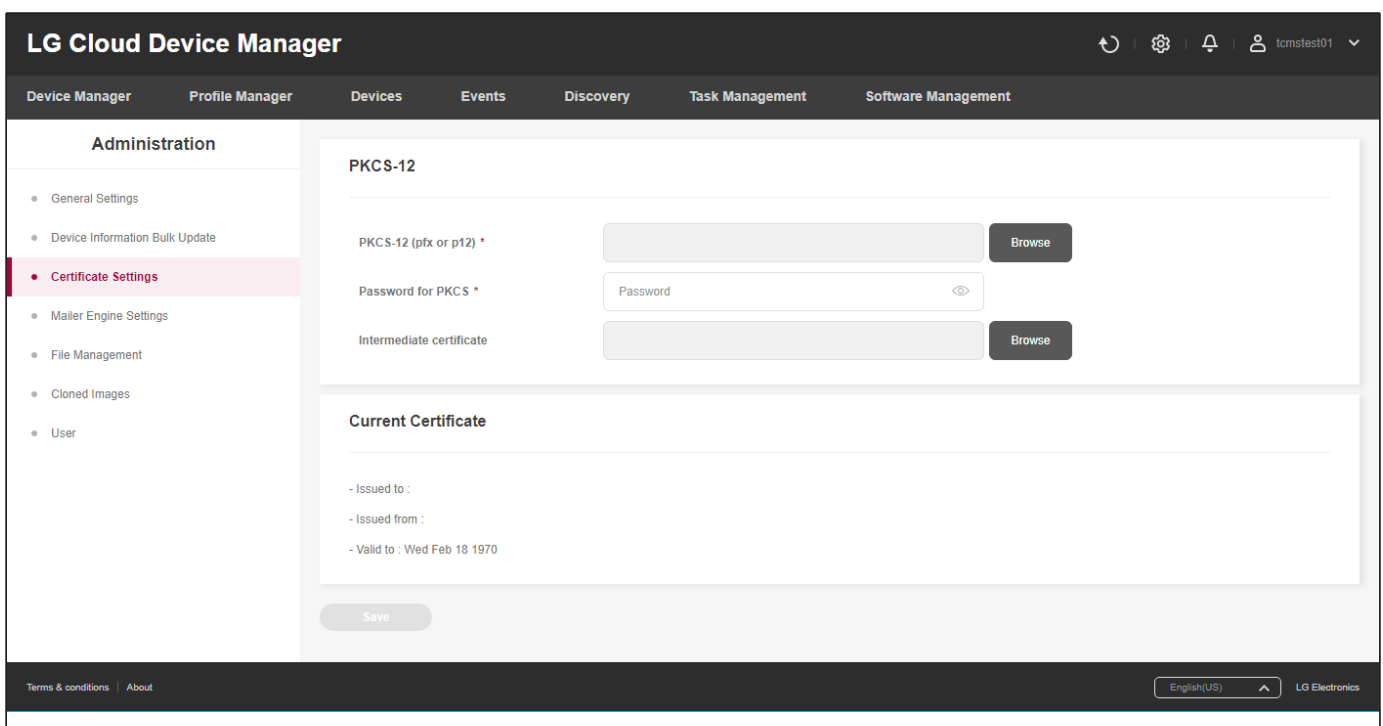

When the installation of LG CDM is completed, a shortcut is created on the desktop (LG CDM.lnk) and the Start menu (Start Menu → LG Electronics → LG CDM). Launch the shortcut on the desktop.

- When accessing from an external device, use the URL below.
 - IP address: `https://<ip address>/lgcdm`
 - FQDN: `https://<FQDN>/lgcdm`

Upon the initial connection, a certificate warning window will appear. Click the Advanced button to enter. (for Chrome)

It is recommended to upload a valid certificate after entering Sign in → [Administration settings] (⚙️) → [Certificate Settings].

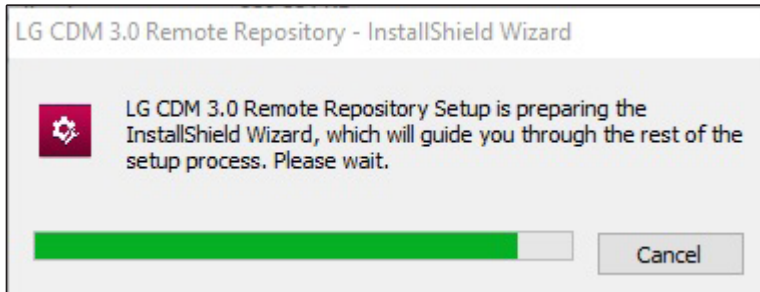

The Sign-in page will be displayed. Sign in by entering the email and password information created in the initial user account creation stage.

Remote Repository Installation Guide

Upon initial installation (including deletion and reinstallation)

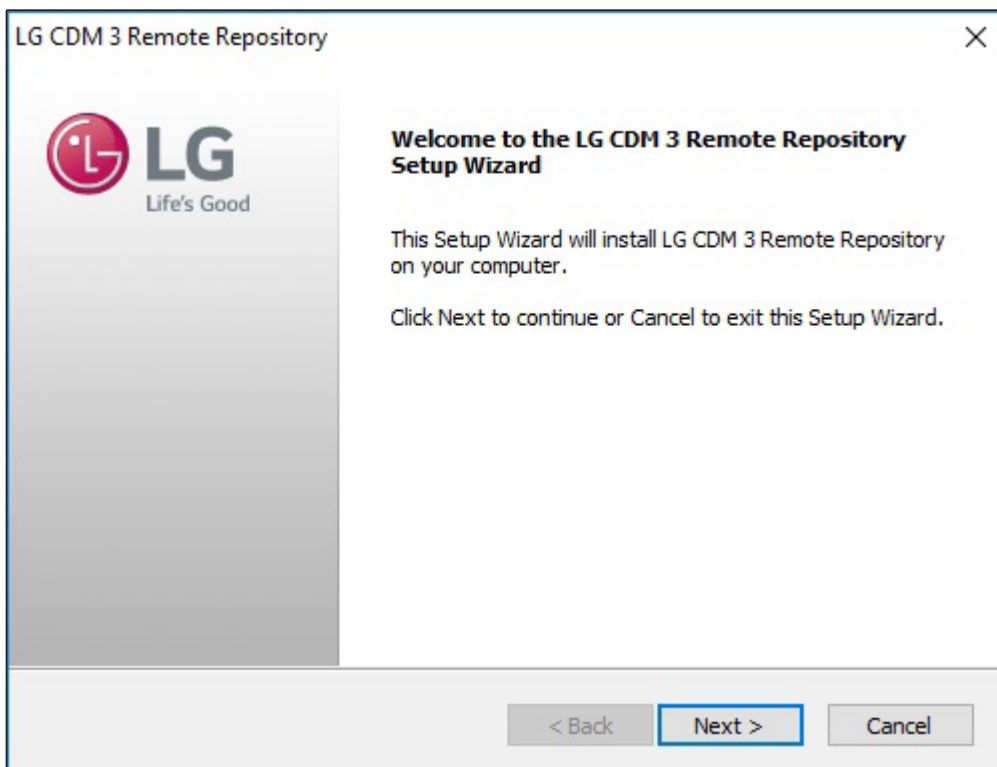

Run the installation file

Preparation

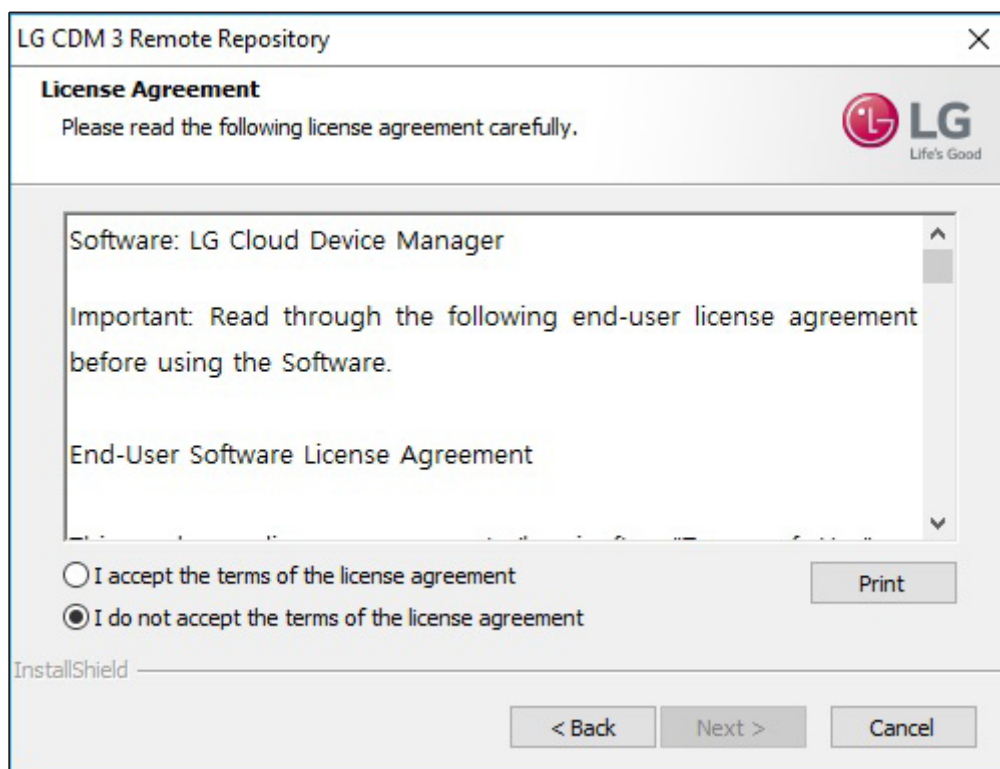

This step will be displayed for a few seconds before moving on to the next step.

Welcome stage

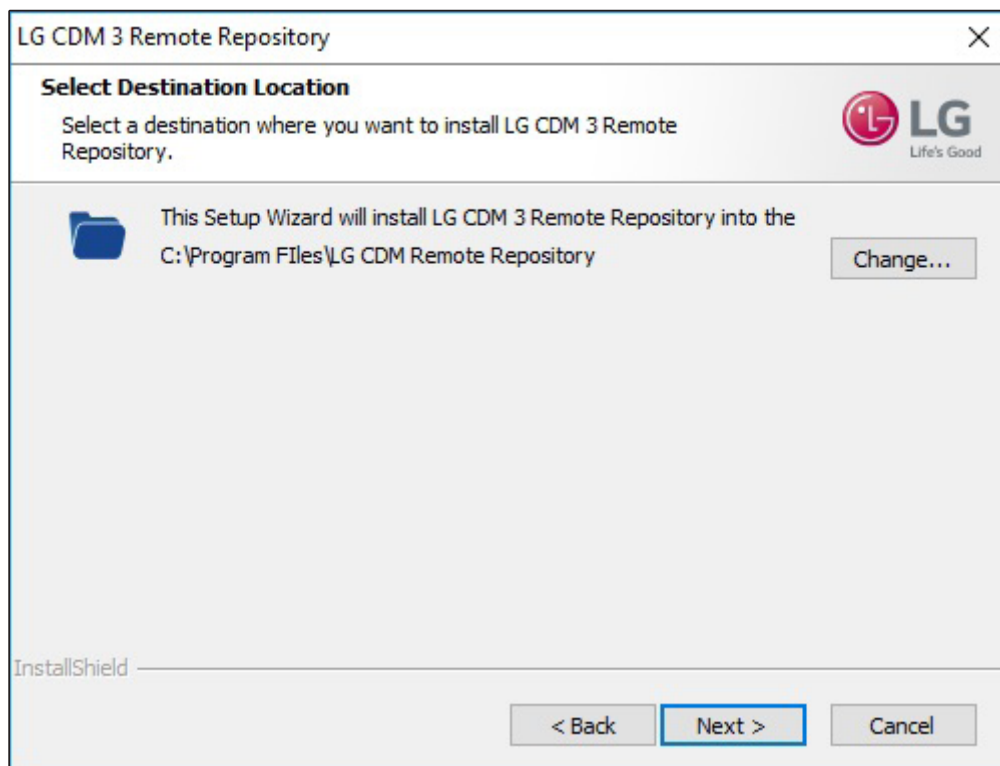

End user license agreement stage

If you do not agree to the User License Agreement, you cannot proceed to the next step.

Select installation location

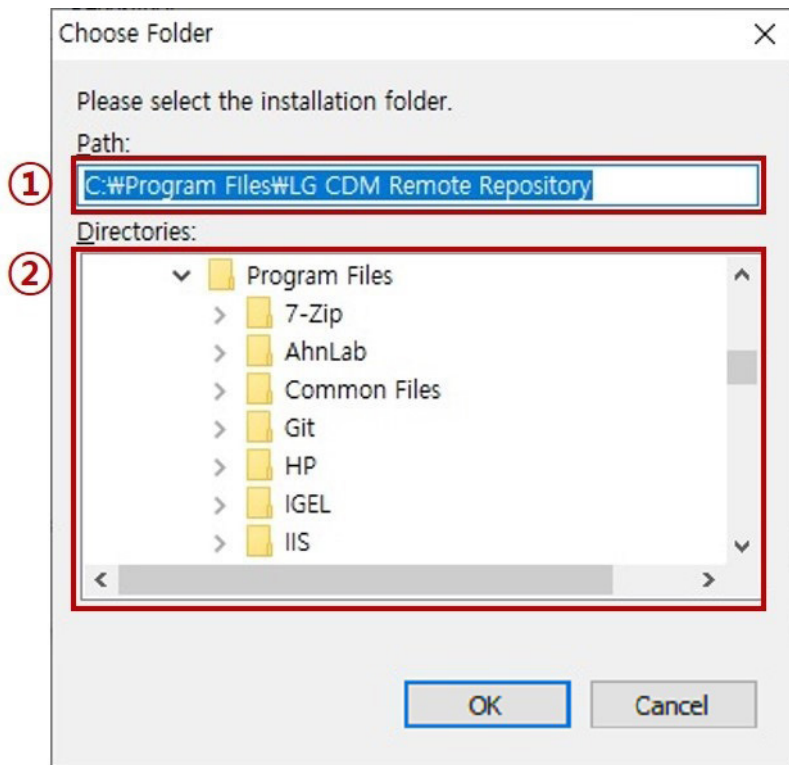

In this step, select the location to install the LG CDM Remote Repository.

If you want to change the default path, click the Change button to specify the path, and then click the Next button to go to the next step.

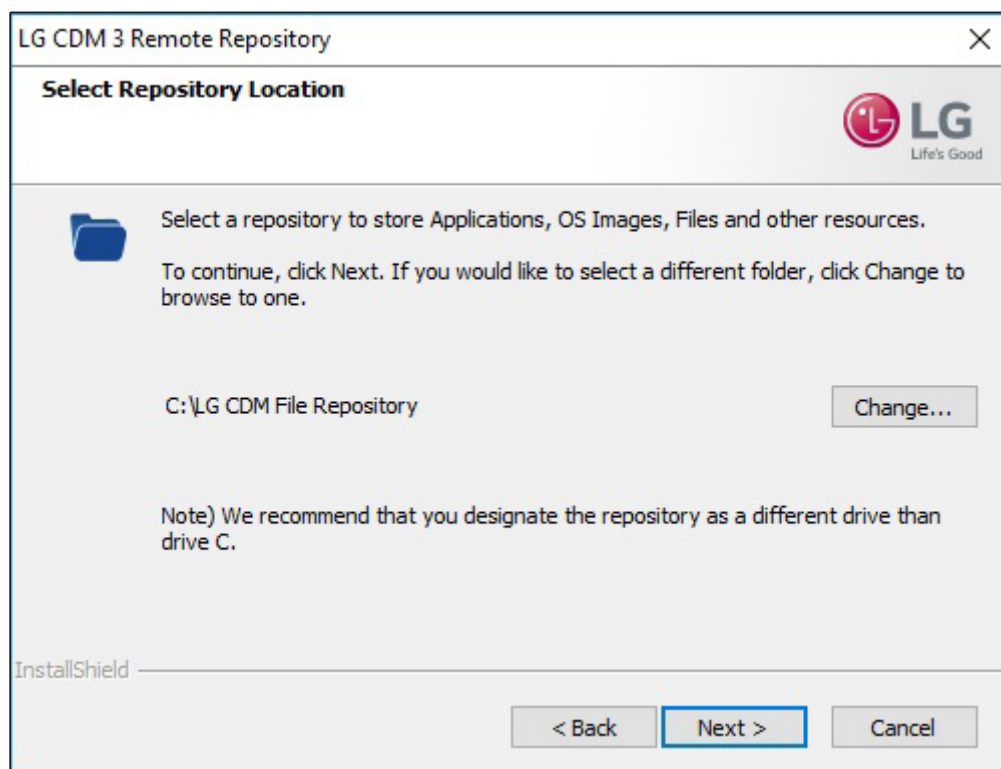

The default setting for the installation path is C:\Program Files\LG CDM Remote Repository.

- When you click the Change button, the following pop-up window appears, allowing you to specify the installation path.

- There are two ways to change the path.
 - Enter the installation path directly into the input box at the bottom of the path and click the OK button. If there is no folder in the specified path, the installer creates one.
Example) C:\WL G CDM Remote Repository
 - In the tree structure at the bottom of the directory, specify the desired folder for installation and click the OK button.

Select repository location

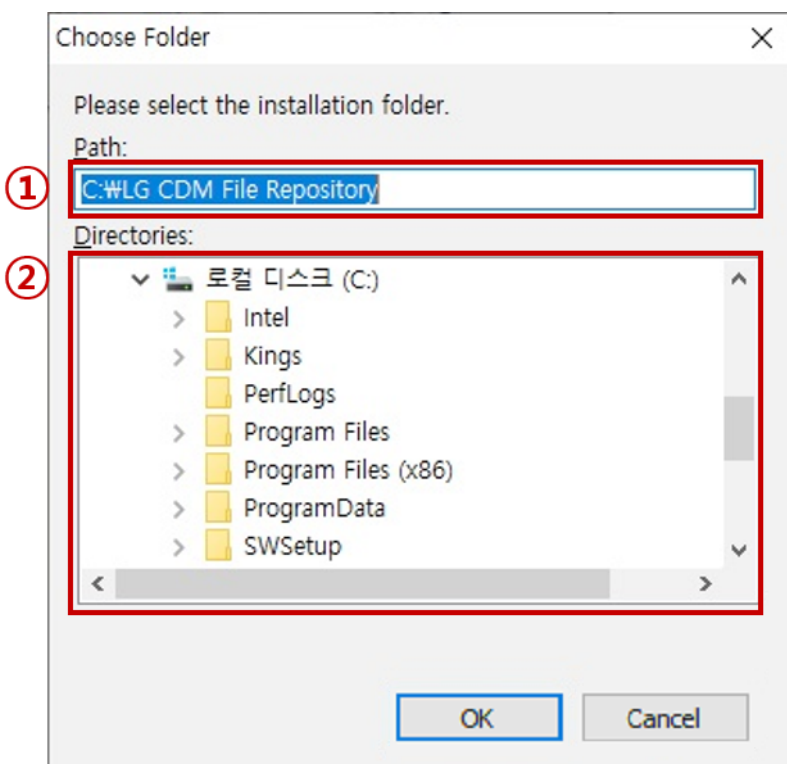

In this stage, you can choose a file repository location.

If you want to change the default path, click the Change button to specify the path, and then click the Next button to go to the next step.

The default setting for the installation path is C:\LG CDM File Repository.

- When you click the Change button, the following pop-up window appears, allowing you to specify the installation path.

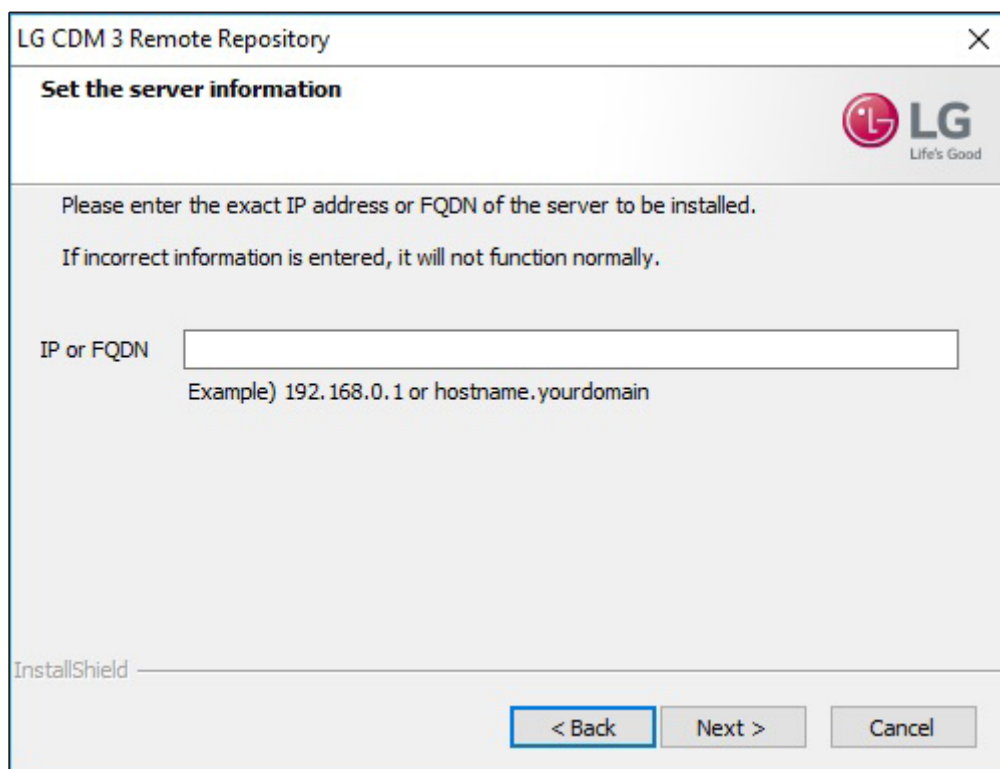

- There are two ways to change the path.
 - Enter the path directly into the input box at the bottom of the path and click the OK button. If there is no folder in the specified path, the installer creates one.
Example) D:\WLG CDM File Repository
 - In the tree structure at the bottom of the directory, specify the desired folder for installation and click the OK button.

! NOTE

- The file repository is large since it contains the copied images, applications to be installed, files to be delivered to the device, etc., are stored. We **recommend selecting a drive other than the C drive** where the operating system is installed.
- If it is installed on the C drive, the system may not operate normally because the disk capacity is full.

Repository information settings

LG CDM 3 Remote Repository

Set the server information

Please enter the exact IP address or FQDN of the server to be installed.
If incorrect information is entered, it will not function normally.

IP or FQDN

Example) 192.168.0.1 or hostname.yourdomain

InstallShield

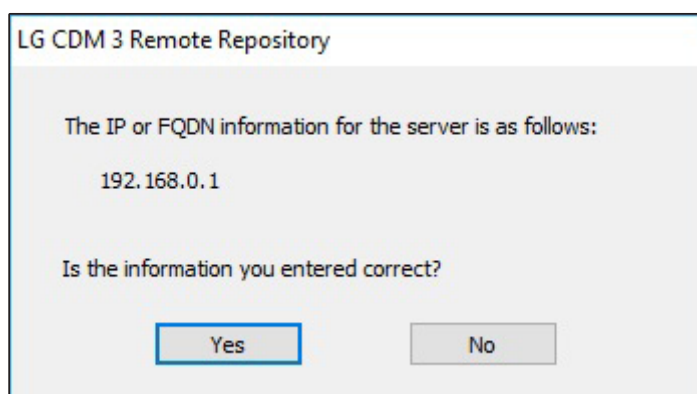

< Back Next > Cancel

In this step, you can enter the IP address or FQDN information of the PC where LG CDM Remote Repository is to be installed.

When you click the Next button, a pop-up window will appear. Double-check to make sure that the information you have entered is correct.

! NOTE

- It does not check whether the entered IP or FQDN is valid.
- Installation may complete even if incorrect information has been entered (i.e., when the IP/FQDN value is entered in the wrong format or is different from the actual information), but the program will not operate normally. Therefore, you must make sure that the information you entered is correct.

LG CDM 3 Remote Repository

The IP or FQDN information for the server is as follows:

192.168.0.1

Is the information you entered correct?

Yes No

Server information settings

LG CDM 3 Remote Repository

Please Input Api Service Information.

Please enter the exact IP address or FQDN, Token of LG CDM Server and P2P Deploy Port.
If incorrect information is entered, it will not function normally.

IP or FQDN
Example) 192.168.0.1 or hostname.yourdomain

Token

Port
(Port Number for P2P Deploy)

InstallShield

< Back Next > Cancel

This is the stage to input the IP address or FQDN information of the server where LG CDM has been installed, Token, and P2P Deploy Port information.

For Token, enter the 12-digit key created when installing the LG CDM server. (After connecting to LG CDM, you can check it in [Administration Settings] (⚙️) - [File Repository].)

Port is the P2P Deploy port specified when installing LG CDM, and if there are no special changes on the LG CDM server, enter the default value of 6881.

When you click the Next button, a pop-up window will appear. Double-check to make sure that the information you have entered is correct.

! NOTE

- It does not check whether the entered IP or FQDN is valid.
- If you do not enter a valid Token, the remote repository will not connect to the LG CDM server.
- Installation may complete even if incorrect information has been entered (i.e., when the IP/FQDN value is entered in the wrong format or is different from the actual information), but the program will not operate normally. Therefore, you must make sure that the information you entered is correct.

LG CDM 3 Remote Repository

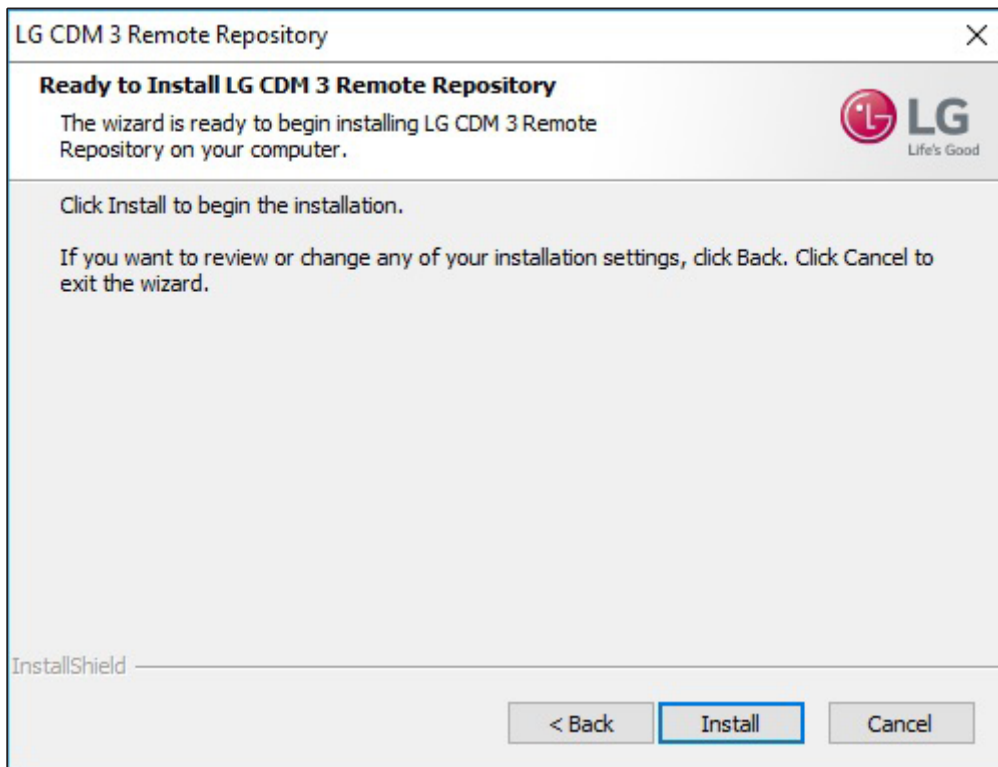

The IP or FQDN information for the server is as follows:

192.168.0.2

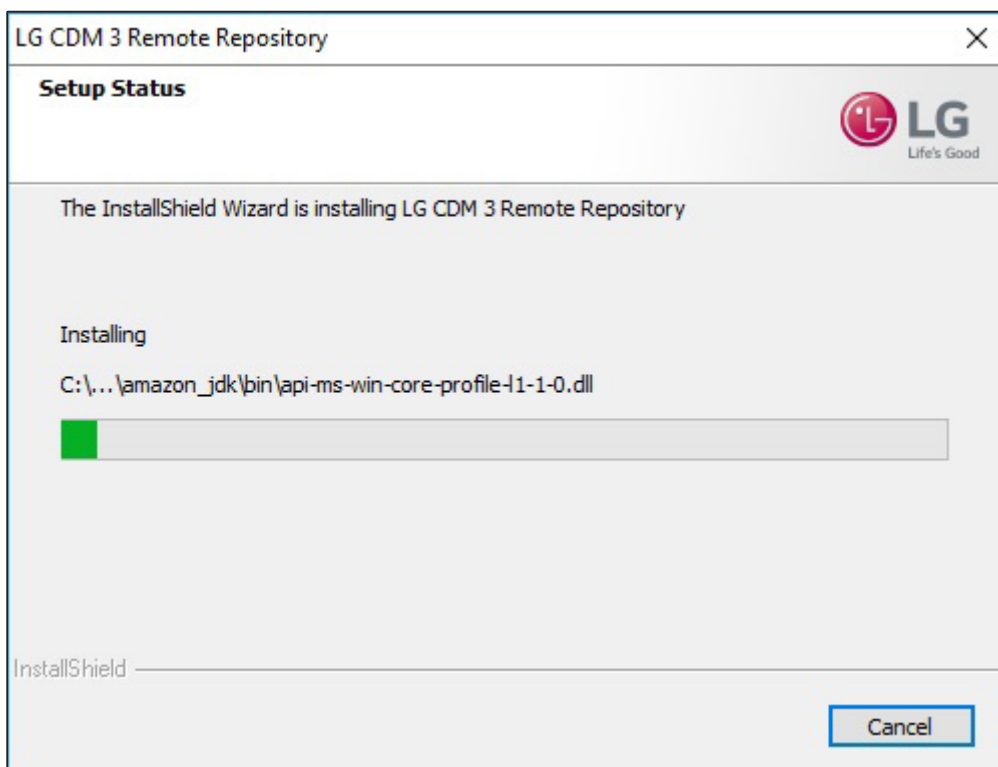

Is the information you entered correct?

Yes No

Installation preparation stage

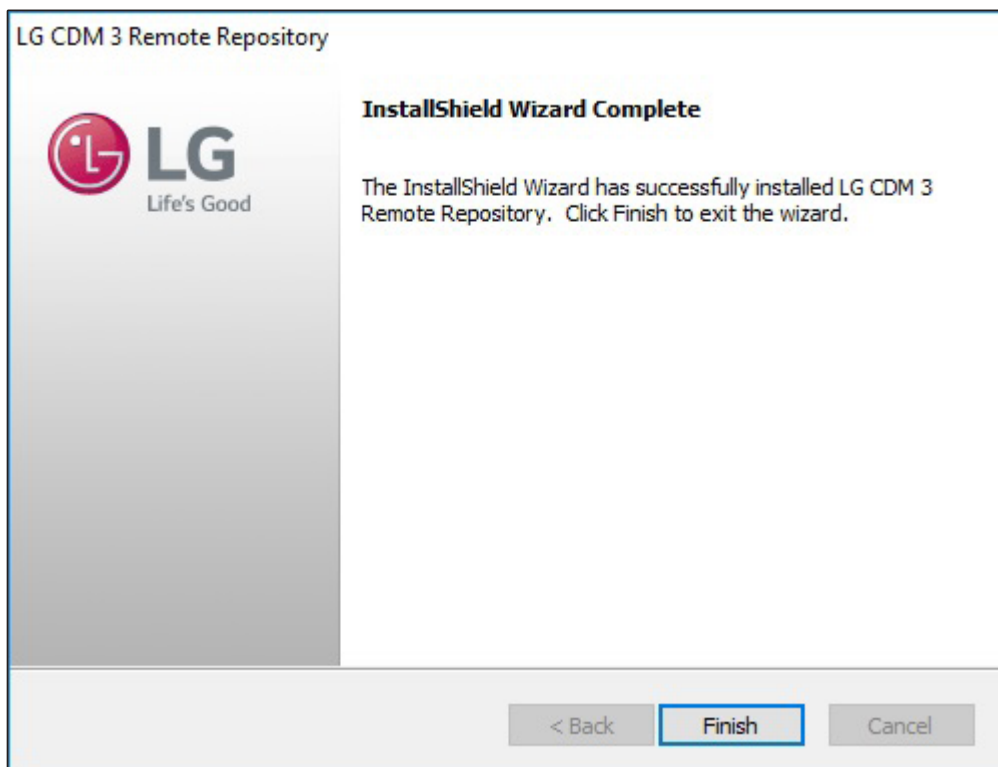

Installation stage

The installation time will vary depending on the performance of your PC, but it normally takes approximately 1-5 minutes.

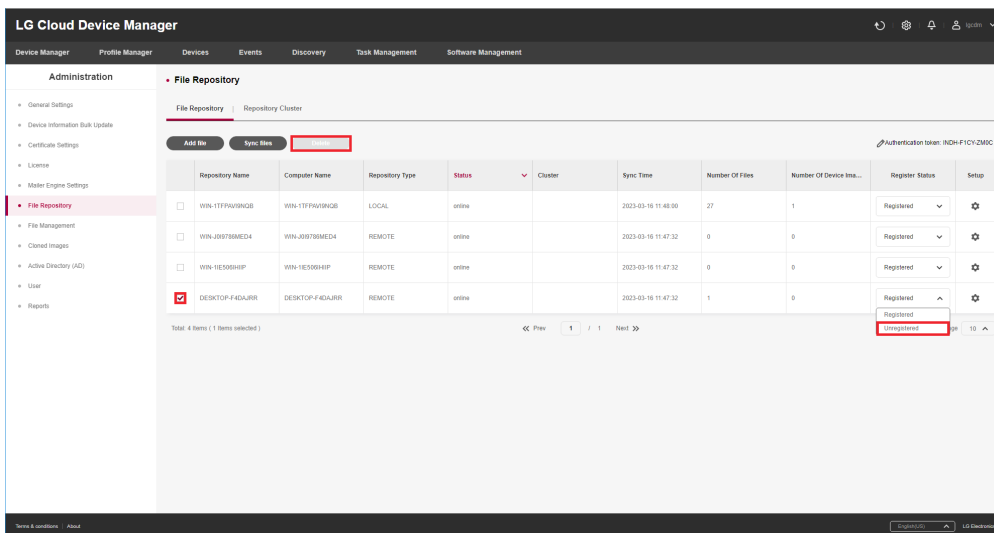

Complete

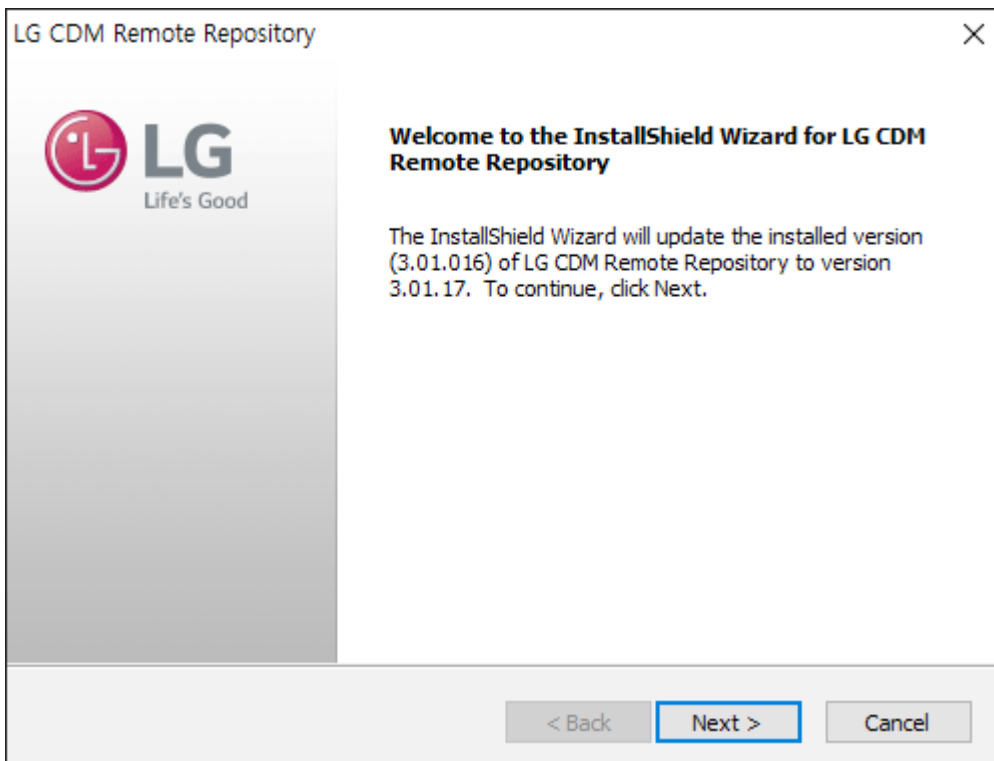

For LG CDM Remote Repository Update

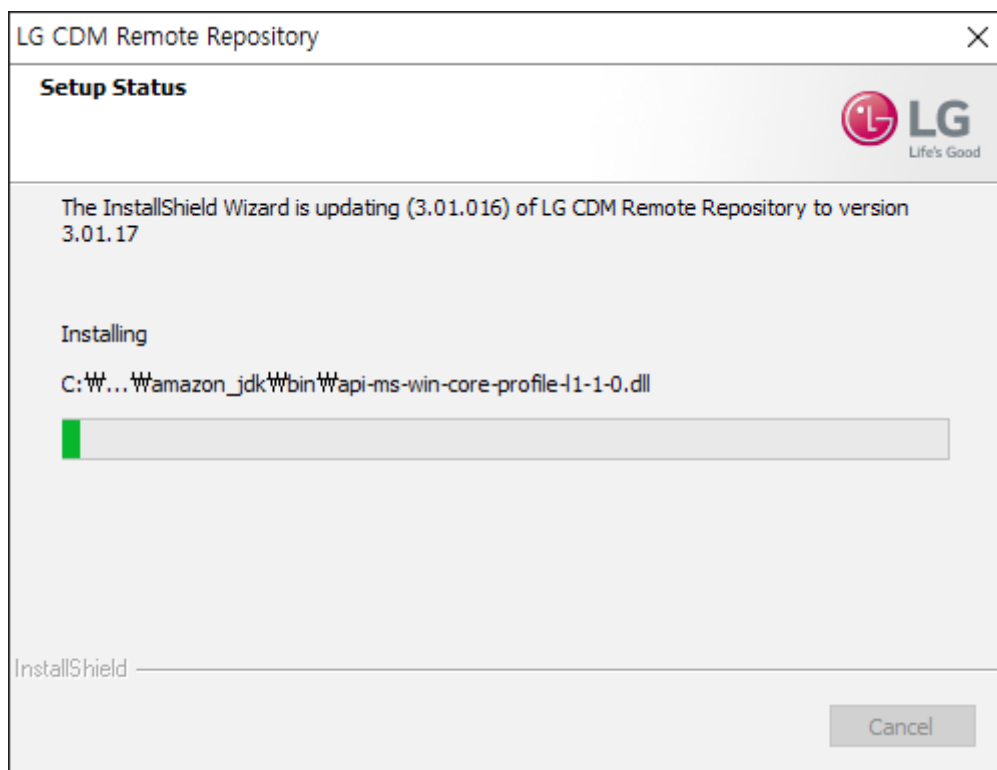

Similarly, it is possible to upgrade the Remote Repository in the same way as the CDM. It is not necessary to delete the old version from the server. Simply run the LG CDM 3.1 Remote Repository installer executable to keep the remote repository updated without losing data and files in the repository. To upgrade the Remote Repository, please follow the steps below:

- 1 Open the CDM console and navigate to [Administration] > [File Repository].
- 2 Select the target remote repository that you want to update, and first unregister and delete the repository from the CDM.

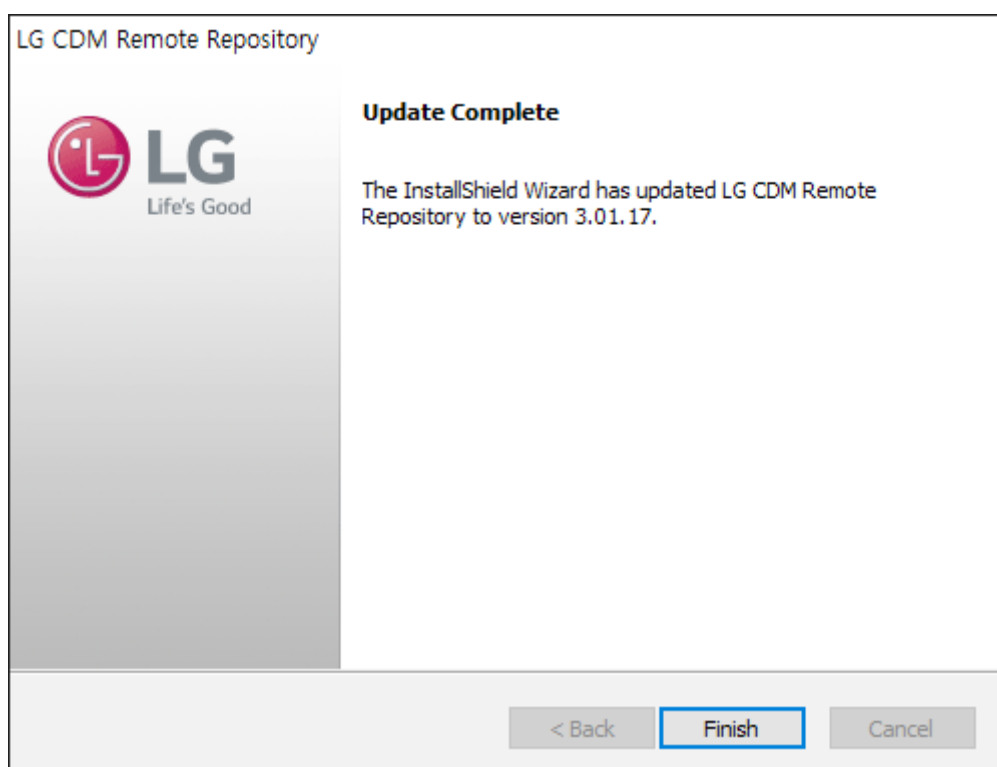

- 3 Access the remote repository server and run the new LG CDM Remote Repository installer executable. Do not delete the old version.
- 4 Click [Next] to proceed the update. The update will proceed automatically.

5 Once the update is complete, click [Finish] to complete the process.

3. To start

Login

You must have a supported browser installed to sign in to the LG Cloud Device Manager console.

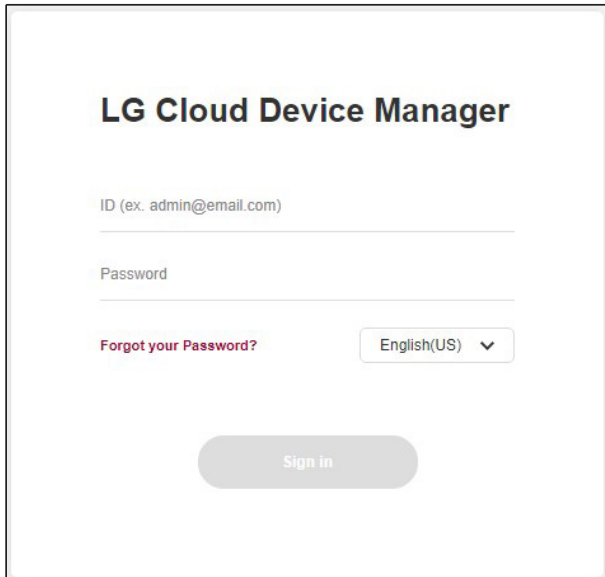

Please check the browser specifications of the system specifications to see information about the supported browser.

You can connect to LG CDM through the LG CDM program icon or by entering the URL below directly into your browser.

- URL: https://IP_or_FQDN/lgcdm

Login (password only)

- 1 Enter your account email and password. At this time, the email and password you enter cannot exceed 50 characters each.
- 2 Select the language to be used in LG CDM.
- 3 Click the [Login] button.

The screenshot shows the LG Cloud Device Manager login interface. At the top, the title "LG Cloud Device Manager" is displayed. Below it, there are two input fields: "ID (ex: admin@email.com)" and "Password". To the left of the password field, there is a link "Forgot your Password?". To the right of the password field, there is a language selection dropdown menu currently set to "English(US)". At the bottom center, there is a "Sign in" button.

Login (password and one-time password)

Security can be enhanced through two-factor authentication, which uses both a password and a one-time password when logging in.

- Prerequisites
 - Log in with an administrator account
 - [Administration Settings] (⚙️) > [Mailer Engine Settings] > [SMTP server configuration]
 - [Administration Settings] (⚙️) > [General settings] > [Sign In Settings] > [Two-factor authentication]: Enable
 - Create a one-time password entry field in the login window when the two-factor authentication setting is complete.
- Login process
 - 1 Enter your account email and password. At this time, the email and password you enter cannot exceed 50 characters each.
 - 2 Click the [Request] button. When the Send Password window appears, click OK.
 - 3 A one-time password for your account will be sent to your email.
 - 4 Enter the one-time password and click the Login button.

Change Password

To change the password, select the account information in the upper right corner while logged in, and select [Change Password].

- 1 Enter the current password.
- 2 Enter the new password.
- 3 Select the [Change Password] button.

Sign Out

To sign out, select the account information in the upper right corner while logged in, and then select [Sign out].

[Forgot your Password?]

If you forgot your password, use this function to find it. To use this function, a valid SMTP server must be set.

- 1 On the sign-in screen, select [Forgot your Password?].
- 2 Enter the e-mail information to receive the e-mail with the URL information for resetting the password, and click the [OK] button.
- 3 Access with the URL information in the received e-mail via the browser.
- 4 Enter and save your new password.

Change Language

On the login screen, you can change the language to Korean, English (United States), German, French, Spanish, Chinese, Japanese, Portuguese (Brazilian ABNT).

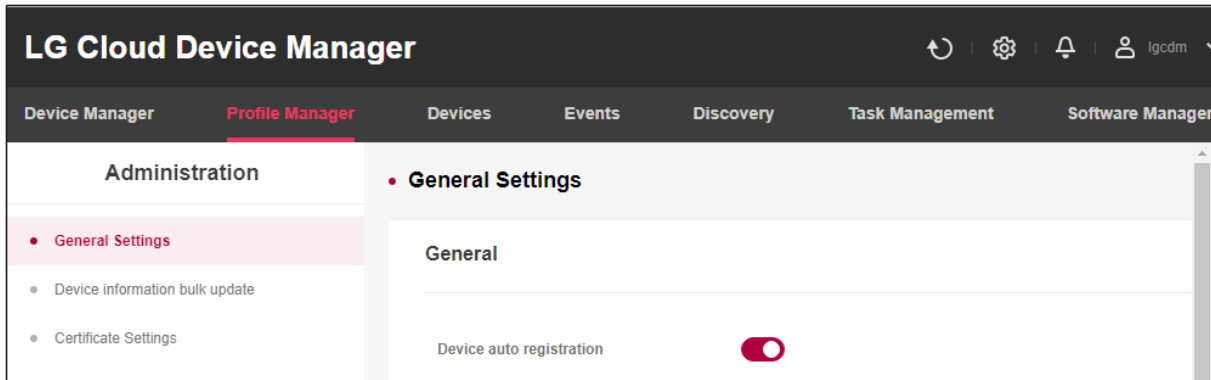

4. Register and Release the Device

Auto Registration

To use LG CDM, the Agent must be connected to the server.

To automatically register the LG Cloud Agent to LG CDM, you have to check whether the Device auto registration item of LG CDM is enabled.

You can check whether it is enabled in [Administration settings] (⚙️) → [General settings] → [Device auto registration].

Automatic registration method through DNS/DHCP server

LG Cloud Agent can recognize the address of LG CDM using the information delivered by the DNS/DHCP server.

Setting up a DNS server for auto registration

Setting up the DNS option is as follows:

- 1 Open Server Manager in Windows Server.
- 2 Open DNS Settings in Tool.
- 3 Select DNS → DNS Server Host Name → Forward Lookup Zones → Target Domain → _tcp and right-click the mouse.
- 4 Select Other new record, select Resource record type as Service Location (SRV), and click Create Record.
- 5 Provide the following detailed information:
 - Service: _lgcdm
 - Protocol: _tcp
 - Port number: 443
 - Host offering this service: FQDN or IP Address of LG CDM ServerExample: If the FQDN of the server where LG CDM is installed is cdm.lge.com, enter cdm.lge.com for "Host offering this service" ("." included).
- 6 When the setting is done, LG Cloud Agent will attempt to connect to the server while booting.

DHCP server setup for auto registration

The following settings are required to automatically register LG Cloud Agent using the DHCP Option:

How to create Option Tag

- 1 Open Server Manager in Windows Server.
- 2 Select Tools → DHCP.
- 3 Select IPv4 and right-click the mouse.
- 4 Select Set Predefined Options.
- 5 Select the DHCP Standard Option value from the Option class list.
- 6 Select Add to see the Option Type window. Enter the following information here and click OK to save.
 - Name: LGCDM
 - Data Type: String
 - Code: 190
- 7 On the Predefined Options and Values screen, find the "LGCDM" item in the Option Name list and enter the value in the following format:
 - LGCDM/[FQDN or IP Address of LG CDM Server]:443
 - Example: If the FQDN of the server where LG CDM is installed is cdm.lge.com, enter LGCDM/cdm.lge.com:443.
- 8 Select the DHCP Scope to which the previously set option is applied.
- 9 After selecting the Configure option, activate the created option.

NOTE

- For the DHCP Option for automatic group registration, please refer to the following information:
 - Name: lgcdm_token
 - Data Type: String
 - Code: 193
- Enter the token string assigned to the group in the LG CDM UI in the part for entering the string.

Device Search and Registration

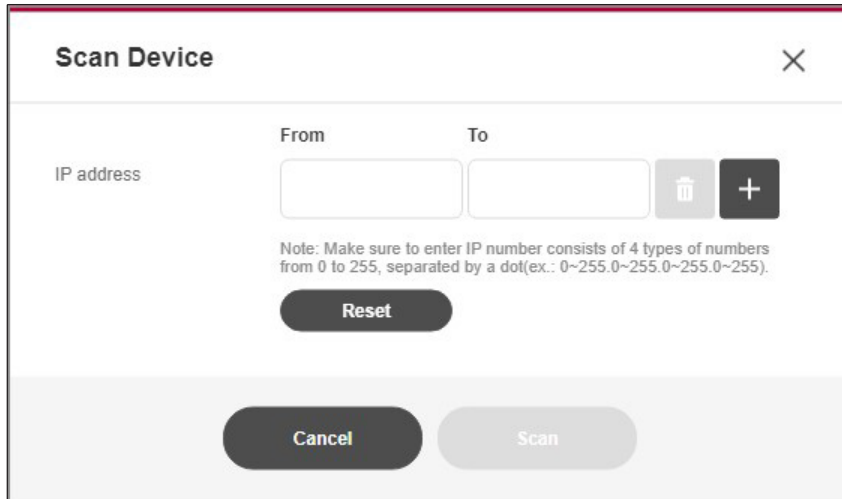

LG CDM can search and register the LG Cloud Agent.

Device search

LG CDM can search the LG Cloud Agent. The administrator can enter the IP range of the device to search and proceed with the search.

Click [Discovery] on the top menu tab of the device to enter the LG Cloud Agent search menu.

- 1 Click the [Scan] button.
- 2 Enter the range of the IP band to search before searching.

Scan Device [X]

IP address

From To [trash] +

Note: Make sure to enter IP number consists of 4 types of numbers from 0 to 255, separated by a dot(ex.: 0~255.0~255.0~255.0~255).

Reset

Cancel Scan

! NOTE

- You can additionally provide a range of IP bands to be searched and can search for up to 1000 IP addresses.
- Previous searched ip address will be displayed.

[Device registration]

The administrator can complete the registration procedure by checking the result of the search and selecting the device to register.

Delete the Scanned Device

You can delete the device from the device scan list. If you delete it, it works as follows.

- If the device is connected to the network, it will reappear in the device scan list after deleting the item
- If the device is not connected to the network, it will not reappear in the device scan list after deleting the item.

! NOTE

- If you want to prevent the deleted device from appearing in the list again, it is recommended that you disconnect the network of device

Manual Registration

If device registration cannot be performed through search in LG CDM, you can register in LG Cloud Agent. To change the settings of LG Cloud Agent, click the LG Cloud Agent tray icon on the right bottom of the corresponding device screen to enter the Agent settings.

Agent Settings

Remote server
IP/Name

0.0.0.0

Port No.

443

Group token

Test Connection

Save

- 1 To set up the Agent, the administrator account information of the OS installed on LG Cloud Device is required. Enter the ID and password of the account that has the administrator privileges.
- 2 [Remote server IP/Name] Enter the FQDN or IP information of LG CDM.
- 3 Enter the port number of LG CDM in [Port No.]. (Default: 443)
- 4 If the Device [Auto Registration] option is set, and a group token is set for a specific group in LG CDM, you can have the device automatically assigned to the specific group by using the information.
- 5 To check the server settings, use the [Test Connection] button to check the settings.
- 6 To complete the server settings and register, use the [Save] button to register.

Unregister

LG CDM provides the following stages to unregister the device:

Right-click the device list of [Device Manager] or [Device], and select [Unregister Device]. Then, such device will be deleted from the [Device Manager] list, and it can be seen in the list of unregistered devices on the [Discovery] tab.

<input type="checkbox"/>	Device ID	MAC address	IP address	Group	Host name	OS version	Model	Move
<input type="checkbox"/>	WINIOT		192.168.1.109	MTC	LGCDM	Microsoft Window...	15ZT90P-GPV21...	
<input type="checkbox"/>	WINIOT		192.168.1.112	MTC	DESKTOP-3ISJQ...	Microsoft Window...	15ZT90P-GPV21...	
<input type="checkbox"/>	WINIOT		192.168.1.106	234324324	DESKTOP-OSET...	Microsoft Window...	CL60	

Delete the Device

[Device delete] means that the LG CDM no longer manages the deleted device. In this case, the device can be re-registered automatically by the DHCP/DNS setup.

If the device is deleted from the unregistered device item, it will operate as follows since it is no longer managed by LG CDM.

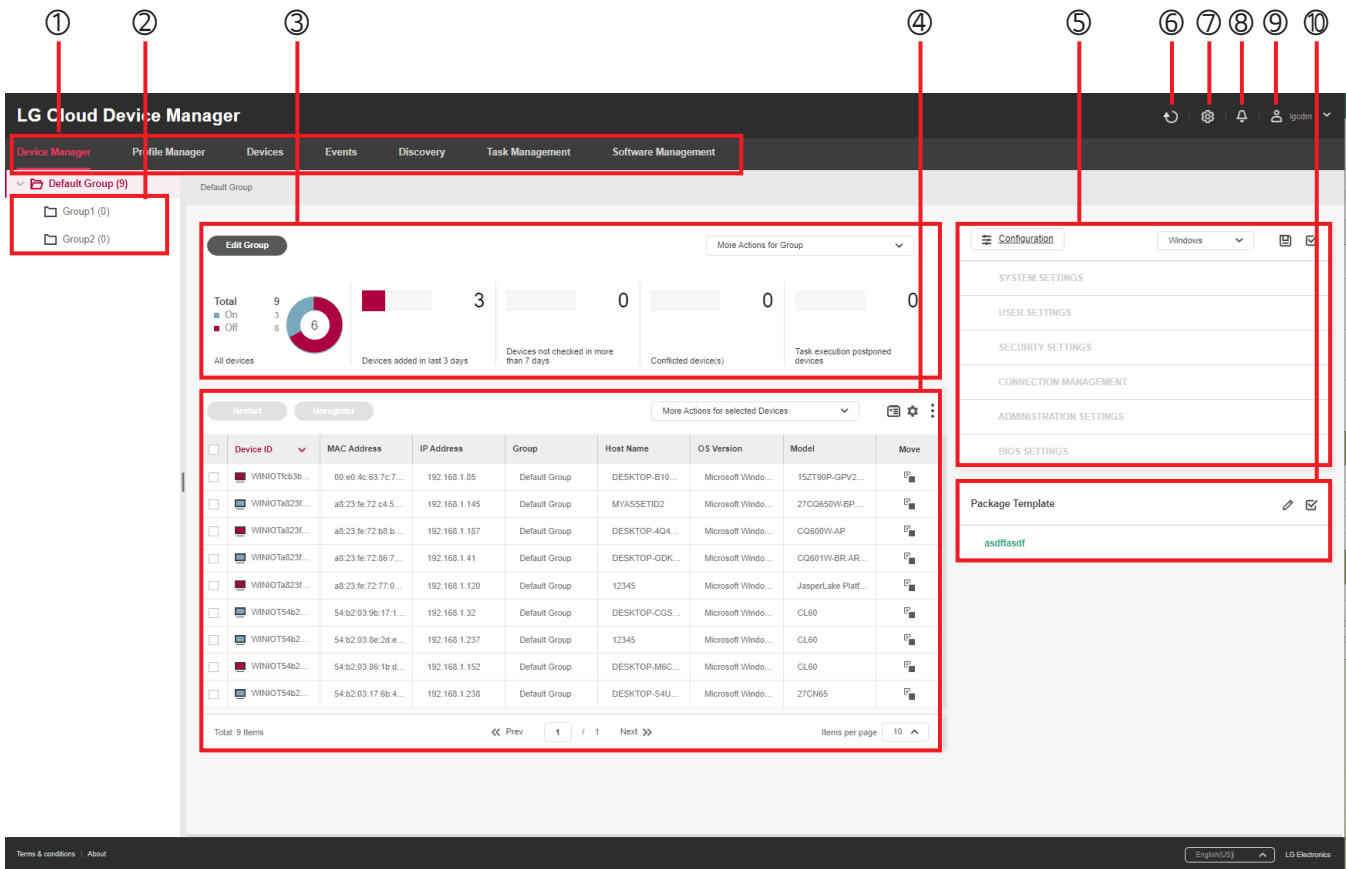

- If the auto registration option is on, and the network and device are connected, it will reappear in the Device Manager list.
- When the auto registration option is off, and the network and device are connected, it will reappear in the device scan list.

NOTE

- If the auto registration option is enabled, and you want to prevent the device from being re-registered, it is recommended that you do not delete it from the unregistered device list.

5. Device Management

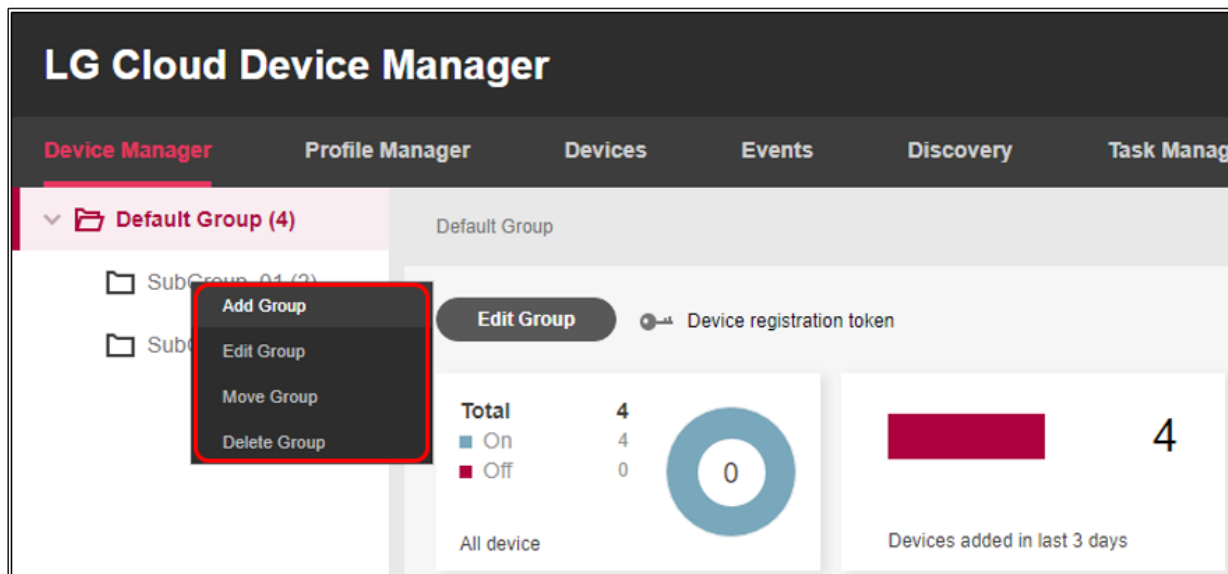

LG CDM menu configuration

- 1 Menu tab: Allows you to go to the menu of [Device Manager], [Profile Manager], [Device], [Events], [Discovery], [Task Management], and [Software management].
- 2 Group management tree: Allows you to create and manage groups for device management.
- 3 Dashboard: Allows you to see the overall status of the devices in the group.
- 4 Device list: Displays a list of devices belonging to the group.
- 5 Configuration: Allows you to set the properties of the device.
- 6 Refresh: Reload the device and group tree information.
- 7 Administration settings: Allows you to manage the settings of LG CDM.
- 8 Notification: Shows the notification items.
- 9 Account information: Shows the logged account and user privilege information.
- 10 Package Template: Allow you to set commands (package templates) to run devices in the group.

Group Management

You can create, change, delete, and move groups to manage devices.

Create group

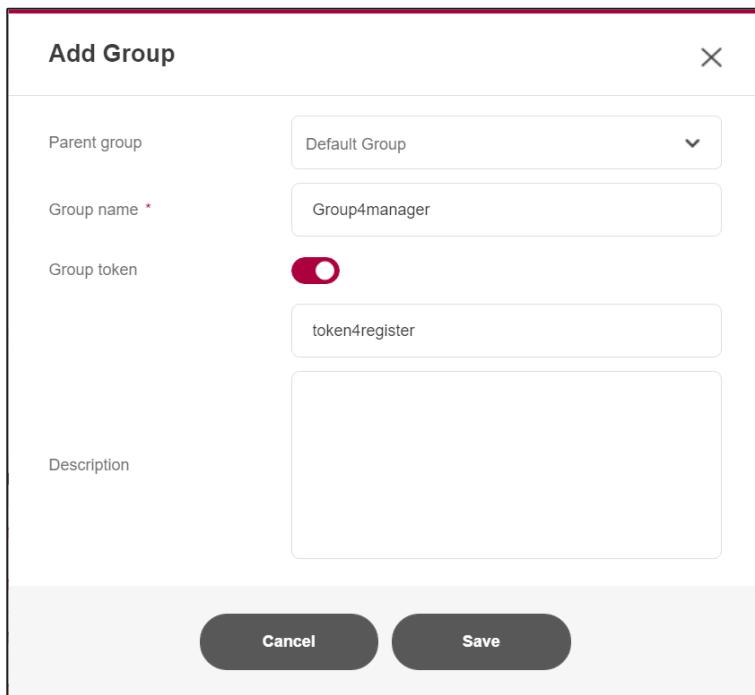

[Default Group] is provided initially, and you can create a subgroup of the group.

If you right-click on a group, it brings up a menu, and you can create a group via the [Add Group] menu.

You can continue to create subgroups up to level 10, including the Default Group.

Group token

You can set [Group Token] when creating a group. [Group token] allows you to automatically move the device to be registered to the corresponding group.

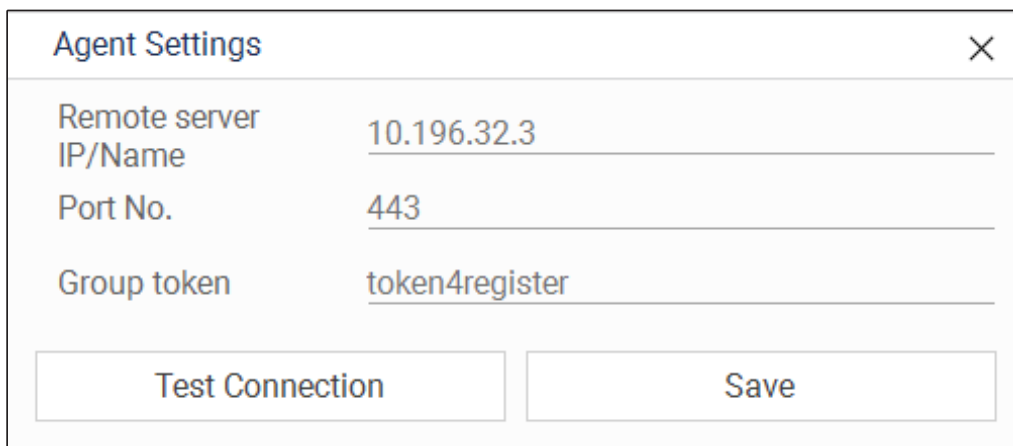

The 'Add Group' dialog box contains the following fields and controls:

- Parent group:** A dropdown menu with 'Default Group' selected.
- Group name:** A text input field containing 'Group4manager'.
- Group token:** A toggle switch that is turned on (red), followed by a text input field containing 'token4register'.
- Description:** A large empty text area.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom.

You can use the [Group Token] created above by choosing one of the methods below.

1 How to enter directly into the agent group token of the device

The 'Agent Settings' dialog box contains the following fields and controls:

- Remote server IP/Name:** A text input field containing '10.196.32.3'.
- Port No.:** A text input field containing '443'.
- Group token:** A text input field containing 'token4register'.
- Buttons:** 'Test Connection' and 'Save' buttons at the bottom.

2 How to register with DHCP option

Name: lgcdm_token

Data Type: String

Code: 193

Replace "String" with the token string that you assigned to the group in the LG CDM UI.

Delete group

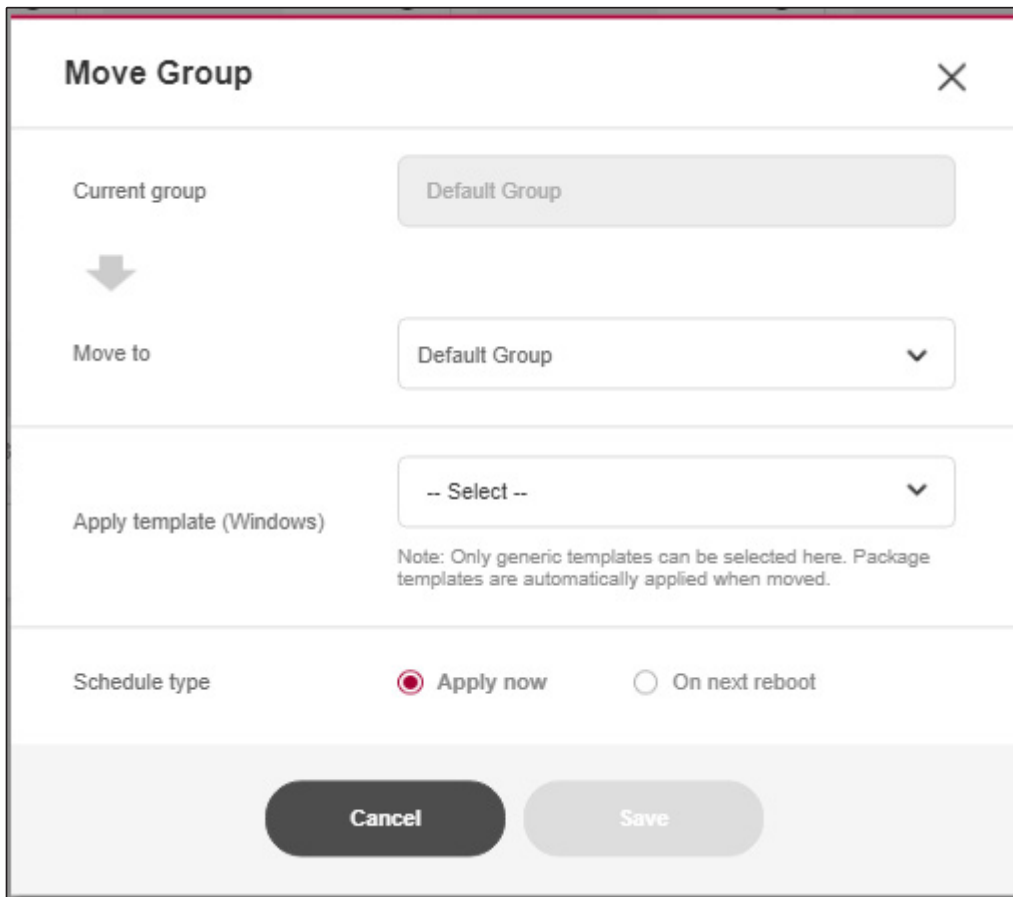

If you do not need a group, you can delete it.

Right-click on the group you want to delete to display a menu. Delete the group via the [Delete Group] menu. If there is any device in the group you want to delete, you must select a group to which the device will move. [Default Group] cannot be deleted.

Move group

You can move a group to a subgroup of another group.

Right-click on the group you want to move to display a menu. Move the group via the [Move Group] menu. [Default Group] cannot be moved.

The image shows a 'Move Group' dialog box with a close button (X) in the top right corner. It contains the following fields and options:

- Current group:** A text field displaying 'Default Group'.
- Move to:** A dropdown menu with 'Default Group' selected and a downward arrow.
- Apply template (Windows):** A dropdown menu with '-- Select --' selected and a downward arrow. Below it is a note: 'Note: Only generic templates can be selected here. Package templates are automatically applied when moved.'
- Schedule type:** Two radio buttons: 'Apply now' (which is selected) and 'On next reboot'.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom.

[Apply template]: You can select the template when moving to a different group.

[Schedule Type]: You can choose when the template should be applied

- [Apply now]: Reboot the device in the moving group and apply the template immediately.
- [On next reboot]: Set boot schedule for the device and the template will be applied as scheduled.

[Device detail information]

If you click a device in the device list to enter this section, you can see the detailed information of the device.

Software Information

[Information]

You can check [System Information], [System Profile], [Hardware Information], and [Software Information] for the device.

- [System Information]: You can enter the information required for device management, such as the place, department, asset number, description, etc.
- [System Profile]: You can check various settings applied to the device.
- [Hardware Information]: You can check the hardware-related details of the device.
- [Software Information]: You can check the details of the software, including its name and version, installed on the device.

[Windows Updates]

You can check the patch update information of the Windows device.

You can download the records of patch update by [Export to CSV].

[Go to Task Management]

You can check the selected device's task progress status from [Task Management].

[Refresh]

You can check the device detail information through manual check-in.

Device Move

You can move the device to other groups for the effective management of devices.

Right-click on the device you want to move to display a menu. Move the device to the desired group via the [Move Device] menu. Or, you can move the group by using the [Move] icon on the far right of the device.

The screenshot shows the LG CDM interface. At the top, there's a summary section with a donut chart showing 7 total devices (1 On, 6 Off). Below this are statistics: 0 devices added in the last 3 days, 1 device not checked in more than 7 days, 0 conflicted devices, and 0 task execution postponed devices. A table lists 7 devices with columns: Device ID, MAC Address, IP Address, Group, Host Name, OS Version, Model, and Move. A context menu is open over the first device, showing options: Move Device, Unregister Device, and Edit Configuration. The bottom of the interface shows pagination: Total: 7 Items, 1 / 1, and Items per page: 10.

! NOTE

- The maximum number of devices that can be managed by LG CDM is 10,000. You need a license key to manage more than 10,000. (For a license key, please contact your local sales representative.)

Move Device Options

The 'Move Device' dialog box has a close button (X) in the top right. It contains the following fields and options:

- Current group:** A text field showing 'Default Group'.
- Move to:** A dropdown menu showing 'Default Group'.
- Apply template (Windows):** A dropdown menu showing '-- Select --'. Below it is a note: 'Note: Only generic templates can be selected here. Package templates are automatically applied when moved.'
- Schedule type:** Two radio buttons: 'Apply now' (selected) and 'On next reboot'.
- Buttons:** 'Cancel' and 'Save' buttons at the bottom.

[Apply template]: You can select the template when moving to a different group.

[Schedule type]: You can choose when the template should be applied

- [Apply now]: Reboot the device in the moving group and apply the template immediately.

- [On next reboot]: Set boot schedule for the device and the template will be applied as scheduled.

Device Menu

You can use filter/search to sort devices. You can add/delete device information to/from the table.

- The function to search via device filtering: By designating a specific value to a specific column in the device list, you can output only the result that matches the specified value in a list.
- Application of the control to the searched devices: You can apply the device control to one or multiple devices by selecting from the searched devices.

Filter value setting

After saving the filter setting value, you can load the saved setting value.

6. Profile Manager

[Profile Manager] manages profiles and templates.

You can save and manage the changes in all or a part of the device settings, which can be changed via LG CDM. This is called a profile.

You can also save commands that are issued to the device in bundles. This is called a template, and it is useful when applying multiple commands to a group or device at once.

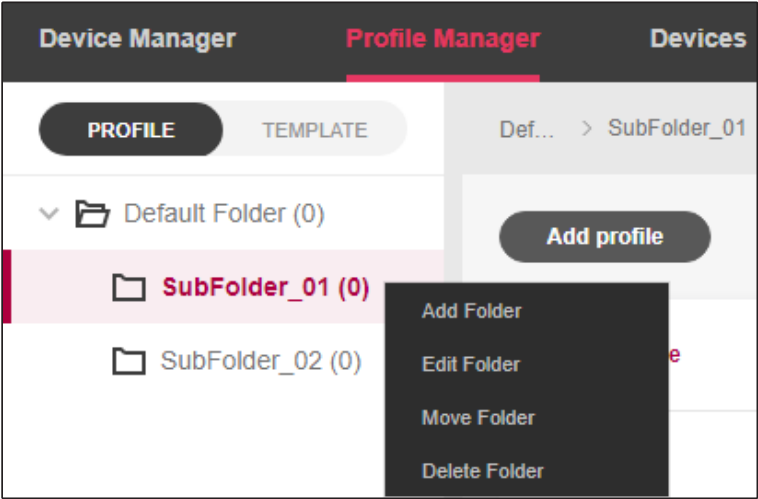

Templates are divided into general templates and package templates. Each of the two templates differs in how and when commands apply to devices.

Commands are executed when an administrator applies a generic template to a group of devices (or devices). Even if the device is moved to the device group afterward, the command is not executed. (1 time)

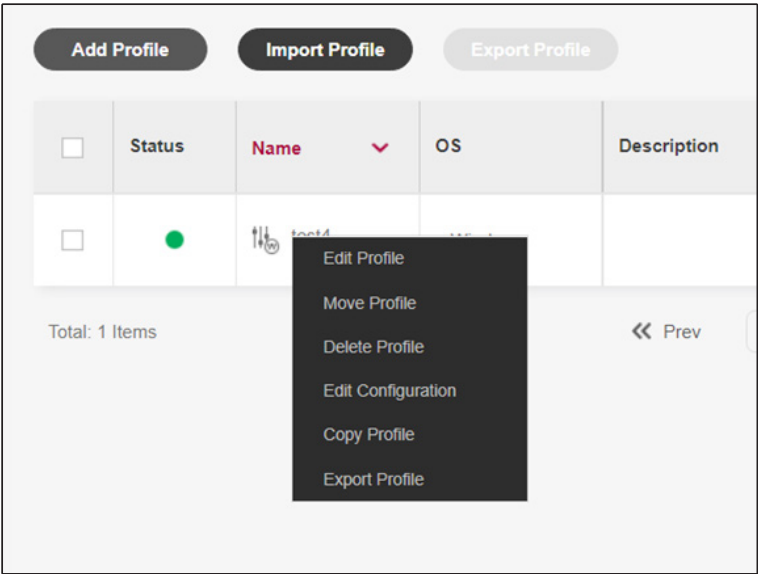

The administrator can select the device group to which the package template will be applied, and the command will be executed when the device is moved to the corresponding device group. (semi-permanent)

Profile Management

It provides the functions to add, edit, move, and delete folders for profile management. It also provides functions such as adding, editing, moving, and deleting profiles, editing preferences, and copying profiles. These functions are performed through the right-click menu in the profile folder tree and the profile list.

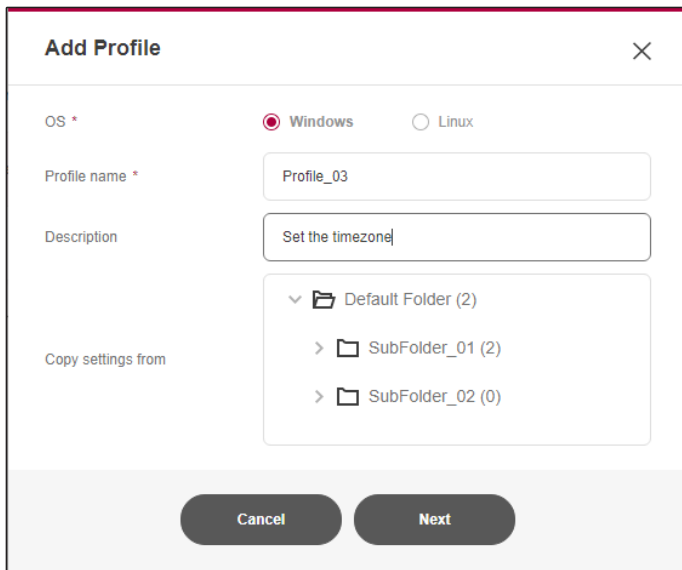

<Right-click menu for profile folder>

<Right-click menu for profile name>

Add Profile

- 1 When adding a profile, the following pop-up will appear. Select the [OS] of the profile to be created and enter [Profile name], [Description], etc. You can import the properties of the existing set profile.

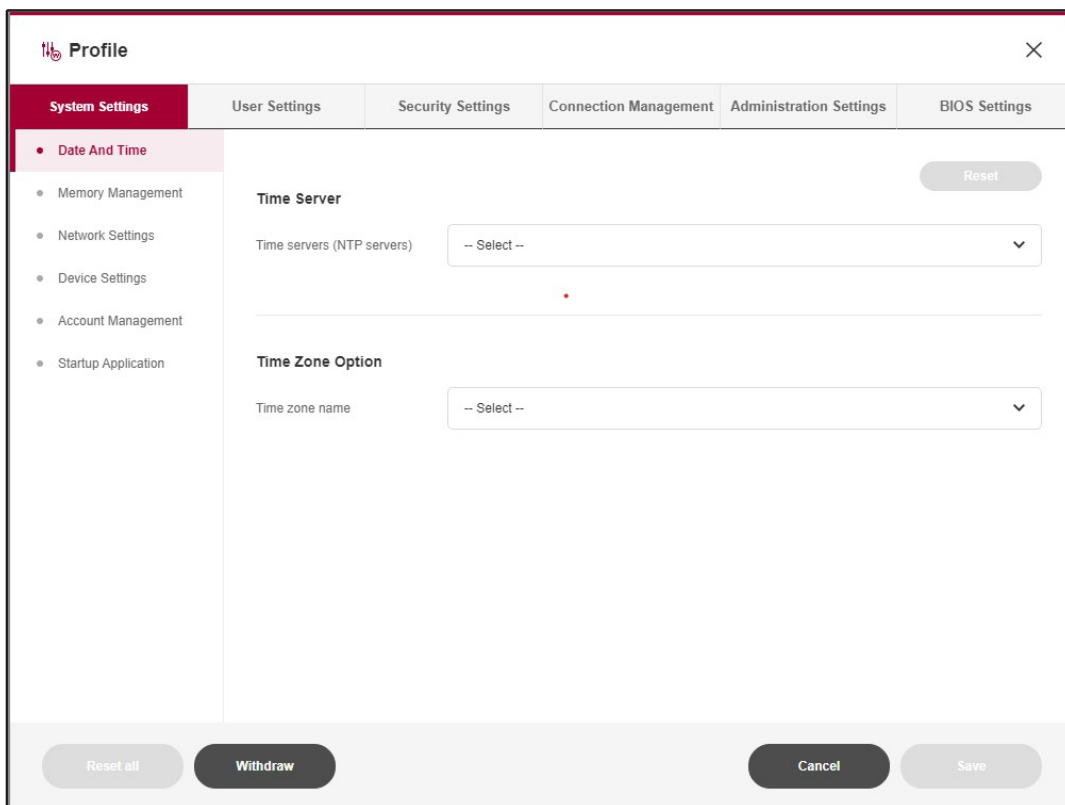

The 'Add Profile' dialog box contains the following fields and options:

- OS ***: Radio buttons for **Windows** (selected) and **Linux**.
- Profile name ***: Text input field containing 'Profile_03'.
- Description**: Text input field containing 'Set the timezone'.
- Copy settings from**: A list of folders with expandable arrows:
 - Default Folder (2)
 - SubFolder_01 (2)
 - SubFolder_02 (0)

At the bottom are **Cancel** and **Next** buttons.

- 2 Click [Next] to display the following setup menu. After applying the required settings, click [Save].

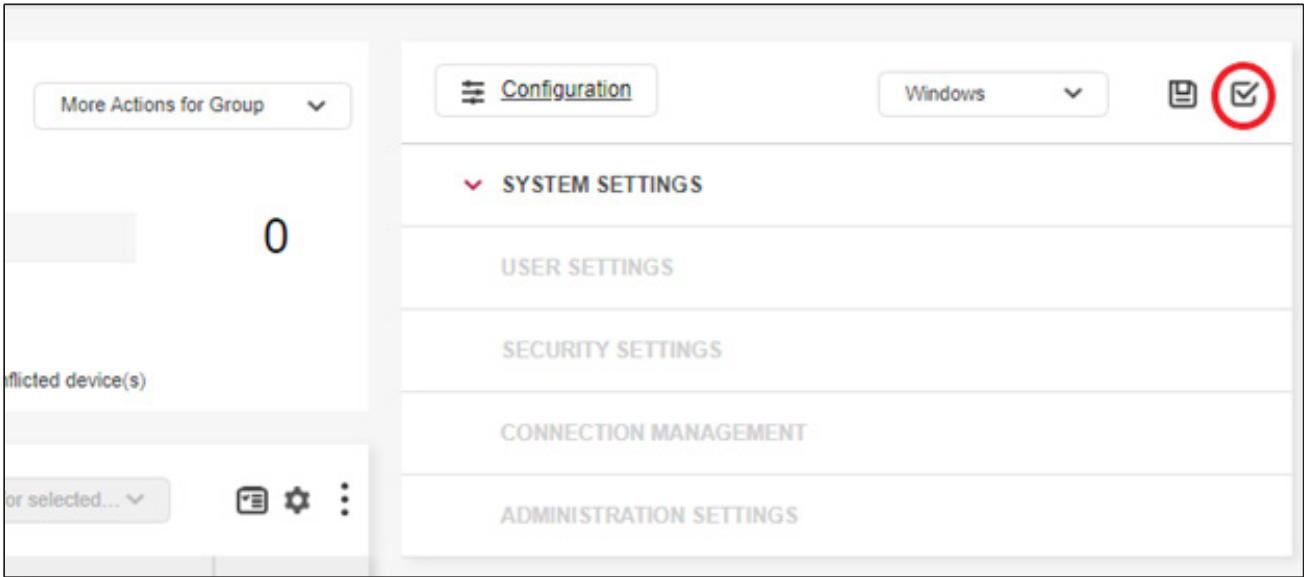

The 'Profile' setup menu has the following structure:

- Profile** title bar with a close button.
- System Settings** (selected) and other tabs: **User Settings**, **Security Settings**, **Connection Management**, **Administration Settings**, **BIOS Settings**.
- Left sidebar** (under System Settings):
 - Date And Time** (selected)
 - Memory Management
 - Network Settings
 - Device Settings
 - Account Management
 - Startup Application
- Main content area**:
 - Time Server** section with a **Reset** button and a dropdown menu labeled 'Time servers (NTP servers)' with value '-- Select --'.
 - Time Zone Option** section with a dropdown menu labeled 'Time zone name' with value '-- Select --'.
- Bottom bar** with buttons: **Reset all**, **Withdraw**, **Cancel**, and **Save**.

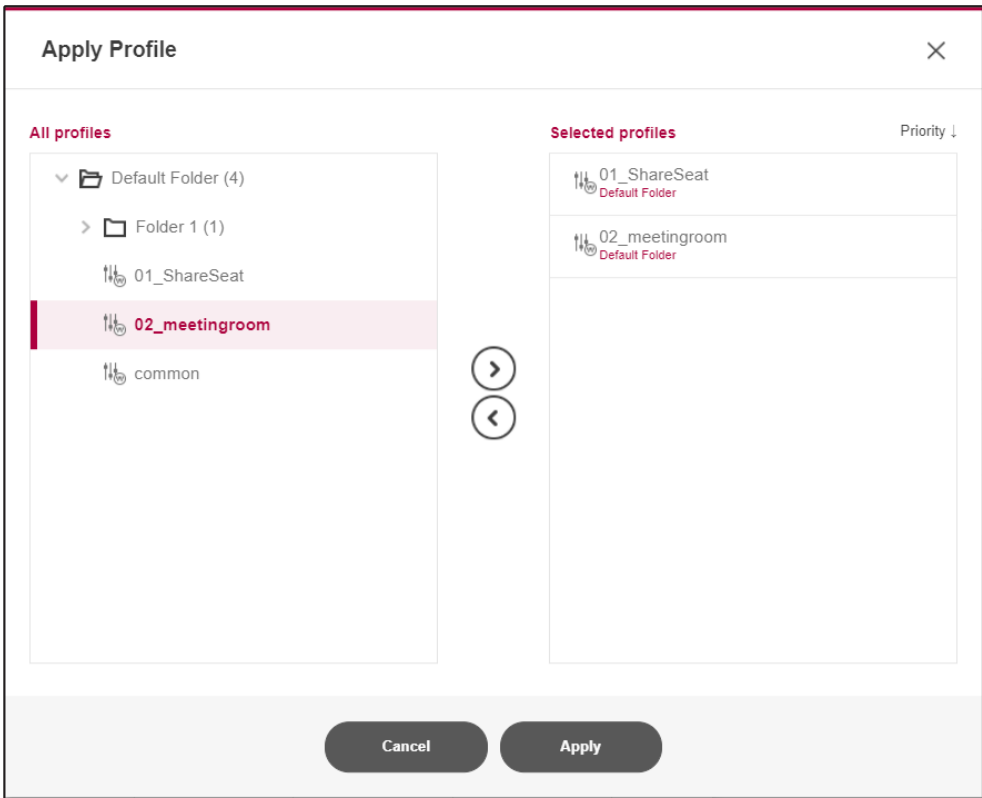

Apply Profile

You can apply a profile to device groups and devices. When applied to a group, the profile settings will be applied to all devices in the group.

You can apply the profile by clicking the  icon of [Configuration] on the right side of the [Device Manager] screen.

At this time, if the same setting item is set for all profiles, the last setting value will be applied.

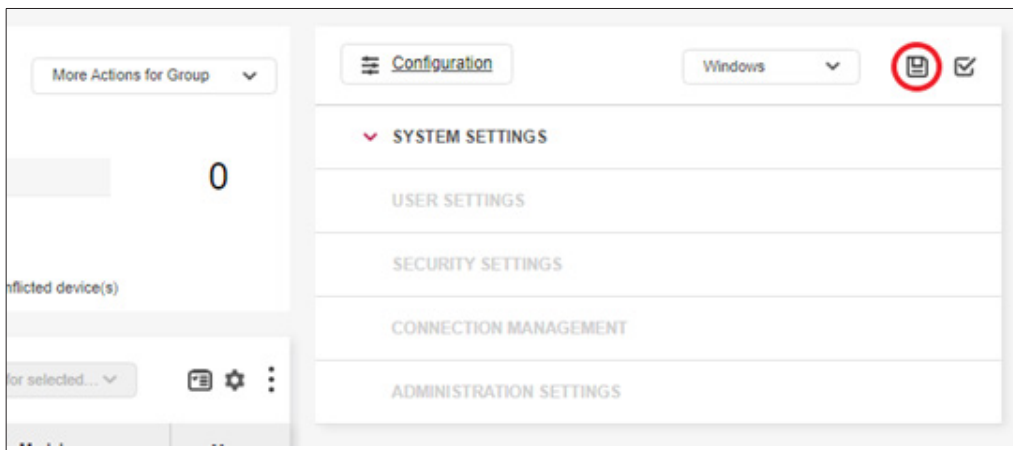

-  **NOTE**
- The setting items are subject to change, and the details can be seen in the [Configuration] category.
 - When subgroups are created, they inherit the setting properties of the parent group. If you change the parent group's setting, the change will also be applied to its subgroups.

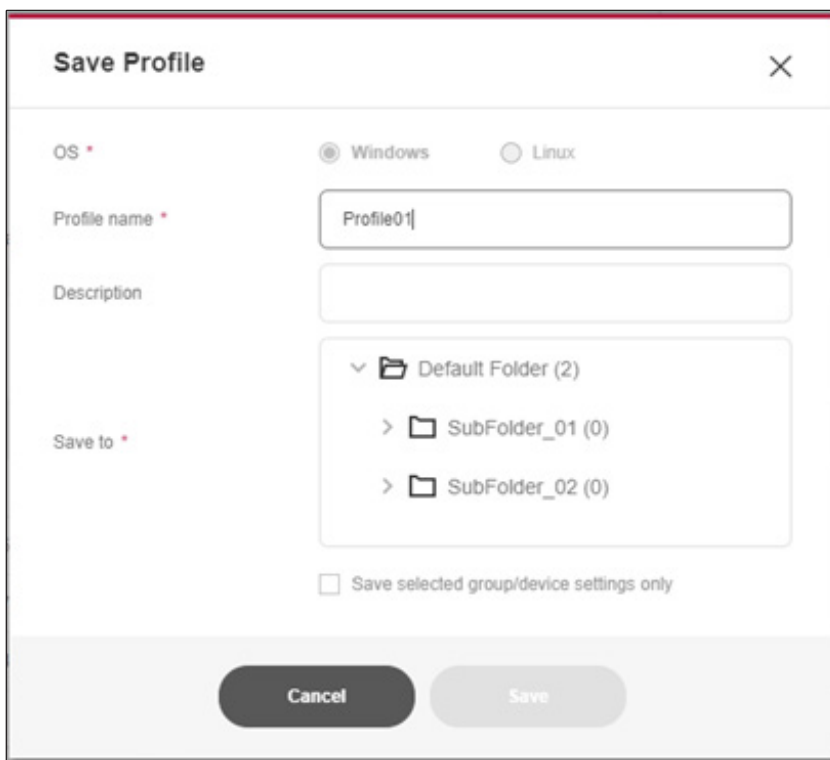

Save Profile

You can save the device group and the settings applied to the device as profiles.

To save a profile, click on the  icon under [Configuration], at the right side of the [Device Manager] screen.

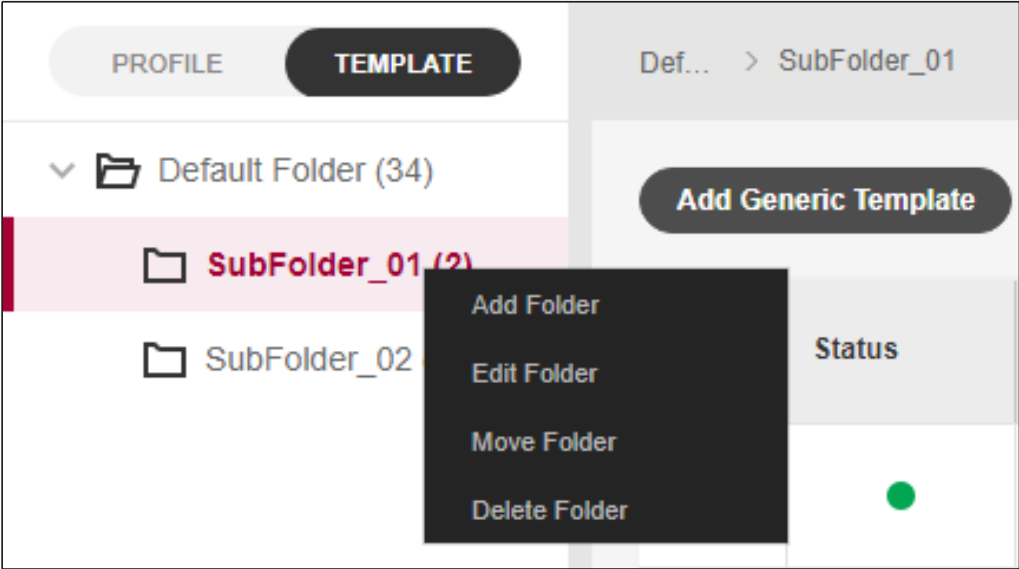

If the setting is also set in the parent group for one setting item, the lowest setting value is saved.

A screenshot of the 'Save Profile' dialog box. It has a title bar with 'Save Profile' and a close button. The form includes: 'OS' with radio buttons for 'Windows' (selected) and 'Linux'; 'Profile name' with a text input containing 'Profile01'; 'Description' with a text input; 'Save to' with a folder selection tree showing 'Default Folder (2)' containing 'SubFolder_01 (0)' and 'SubFolder_02 (0)'; and a checkbox labeled 'Save selected group/device settings only' which is currently unchecked. At the bottom are 'Cancel' and 'Save' buttons.

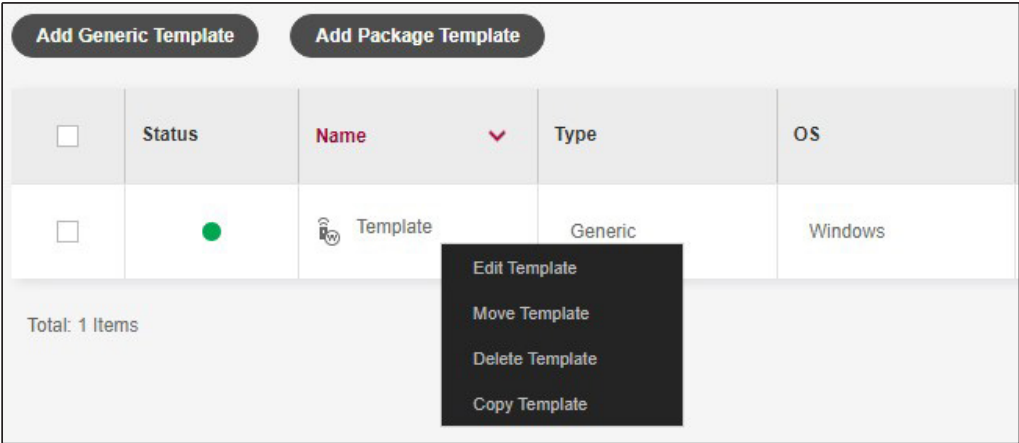

Selecting [Save selected group/device settings only] allows the new profile to retrieve the configurations from only the selected group and device. Not selecting such an option will have the new profile to have the configuration of selected group and its parent-groups if there is any.

Template Management

It provides the functions to add, edit, move, and delete folders for template management. It also provides functions such as adding, editing, moving, deleting, and copying templates. These functions are performed through the right-click menu in the folder tree and template list of templates.

<Right-click menu for template folder>

<Right-click menu for template file>

The template status indicates whether the template can be applied normally according to status of the file repository(registered/unregistered).

Add Generic Template

- 1 Click the [Add Generic Template] button to display the pop-up menu shown below.

The screenshot shows a modal window titled "Add Generic Template" with a close button (X) in the top right corner. Inside the modal, there are several input fields and controls:

- OS ***: Two radio buttons, "Windows" (selected) and "Linux".
- Template name ***: A text input field.
- Description**: A text input field.
- Command ***: A dropdown menu showing "-- Select --" with a plus button to the right. Below the dropdown is a dark button with a white "+" symbol.
- Buttons**: At the bottom of the modal are two buttons: "Cancel" and "Save".

- 2 Select the [OS] of the template to be created and fill in [Template name], [Description], etc. Click the '+' button to add remote control items.
 - The remote control commands that can be added to the template are as follows:

Remote control item	Windows	Linux
[Lock Computer]	O	O
[Restart]	O	O
[Shutdown]	O	O
[Log Off]	O	O
[File Transfer]	O	O
[File Delete]	O	O
[SW & Patch Install]	O	O
[SW & Patch Uninstall]	O	O
[Deploy Image]	O	O
[Push Image]	O	X
[Apply Registry]	O	X
[Application Command]	O	O
[Update Agent]	O	O

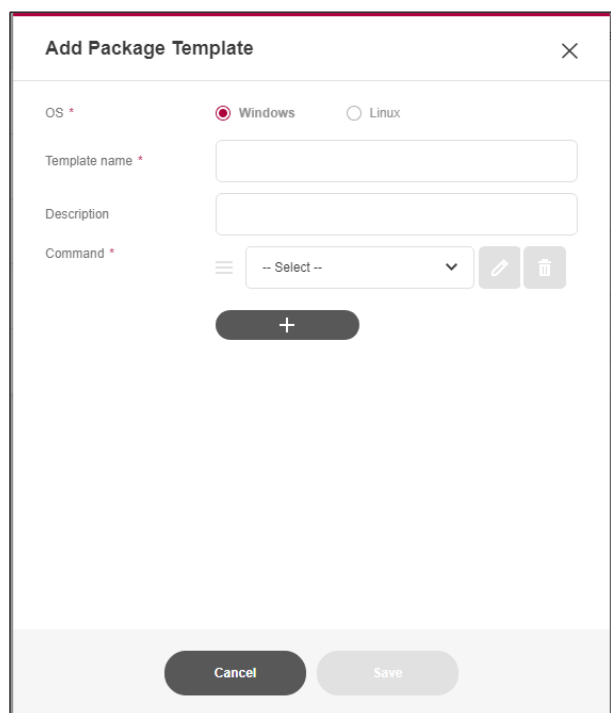

- 3 [File Transfer], [File Delete], [SW & Patch Install], [SW & Patch Uninstall], [Deploy Image], [Push Image], [Apply Registry], [Application Command], and [Update Agent] must be set in detail by editing. Click the [Save] button to save the template.

Apply Generic Template

- 1 After selecting a device group, perform [More functions (groups)] → [Apply template]
Or, after selecting a device, perform [More functions (selected device)] → [Apply template].
- 2 Select and apply a generic template on the [Apply Template] pop-up.

Add Package Template

- 1 Click the [Add Package Template] button to display the pop-up menu shown below.

- 2 Select the [OS] of the template to be created and fill in [Template name], [Description], etc. Click the '+' button to add remote control items.

- The remote control commands that can be added to the template are as follows:

Remote control item	Windows	Linux
[Restart]	O	O
[File Transfer]	O	O
[File Delete]	O	O
[SW & Patch Install]	O	O
[SW & Patch Uninstall]	O	O
[Apply Registry]	O	X
[Application command]	O	O
[Update Agent]	O	O

- 3 [File Transfer], [File Delete], [SW & patch install], [SW & Patch Uninstall], [Apply Registry], [Application Command], and [Update Agent] must be set in detail by editing. Click the [Save] button to save the template.

Apply Generic Template

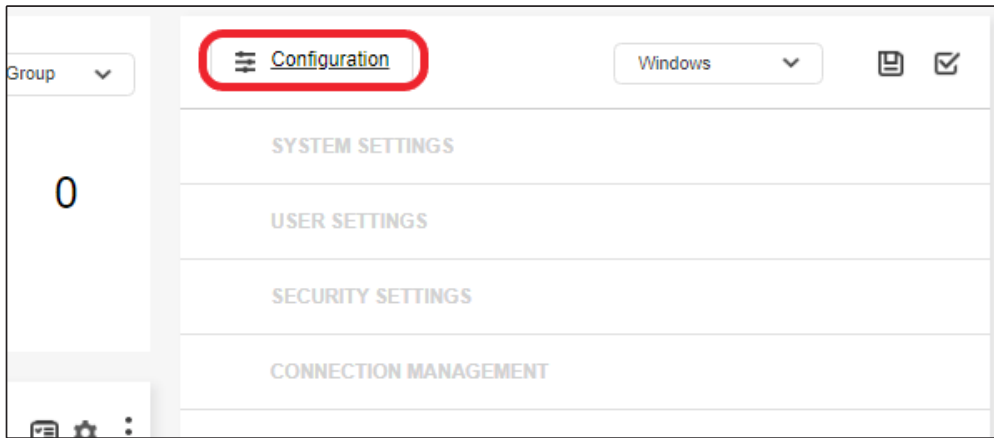

- 1 After selecting a device group, click [Edit Package Template].
- 2 Select and save the previously created package template from the [Edit Package Template List] pop-up.
- 3 The package template is automatically applied when the device is moved, or it can be applied manually through the [Apply Package Template] button.

7. Change Settings

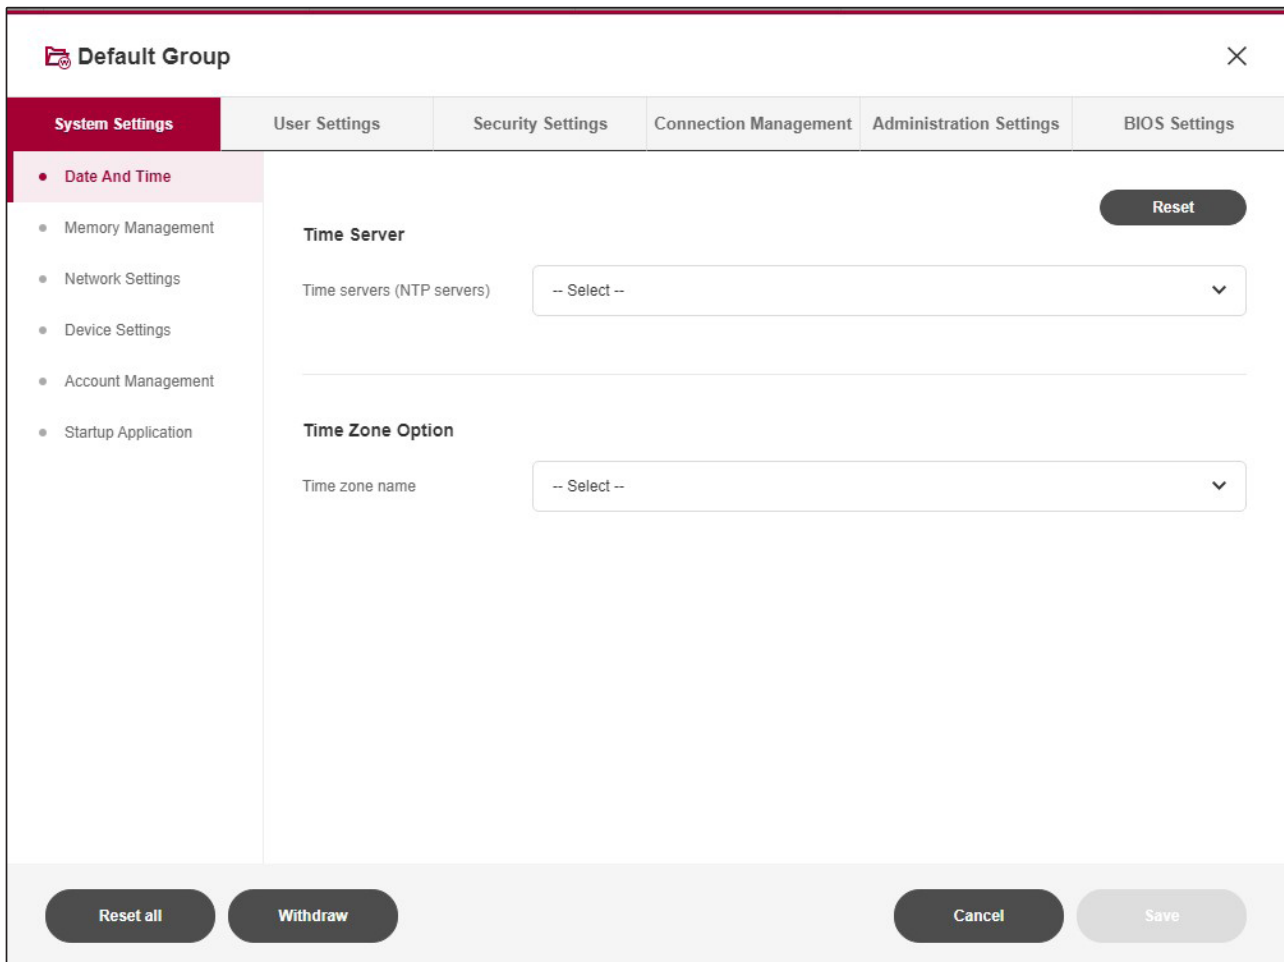

You can configure a device group or settings for a device.

You can change the setting items by clicking on the word [Configuration] at the right side of the [Device Manager] screen.

After setting the item you want, click [Save].

For group settings, select the OS and enter the settings window.

! NOTE

- Configurations that use files in the repository display a warning notification when the repository is disconnected or files in the repository are deleted.

8. Remote Control

LG CDM provides the remote control function for the device.

- There are differences in the available functions when controlling the group or individual devices. The functions available to control groups or individual devices are as follows:

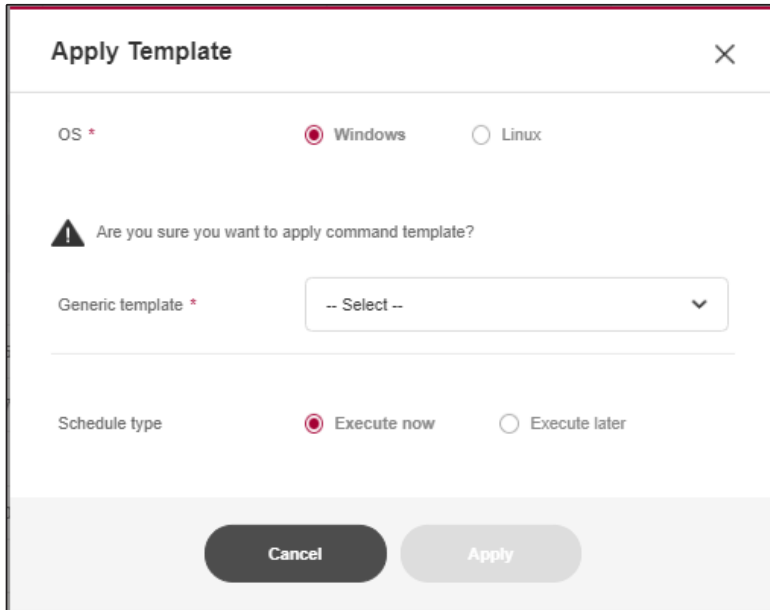

Control function	Group	Individual device (Windows)	Individual device (Linux)
[Apply Template]	O	O	O
[Send Message]	O	O	O
[Lock Computer]	O	O	O
[Restart]	O	O	O
[Shutdown]	O	O	O
[Log Off]	O	O	O
[Wake On LAN]	O	O	O
[File Transfer]	O	O	O
[File Delete]	O	O	O
[Import File]	X	O	O
[SW & Patch Install]	O	O	O
[SW & Patch Uninstall]	O	O	O
[Clone Image]	X	O	O
[Deploy Image]	O	O	O
[Push Image]	O	O	X
[Pull Image]	X	O	X
[Request Log File]	X	O	O
[Get Registry]	X	O	X
[Apply Registry]	O	O	X
[Application Command]	O	O	O
[Force Configuration Update]	O	O	O
[Shadowing (VNC)]	X	O	O
[Update Agent]	O	O	O
[Check Network Status]	X	O	O

[Apply Template]

You can apply pre-made templates to groups or devices that belong to a group.

When applying a template, select the OS first, and then select and apply the template suitable for the OS from the list of templates.

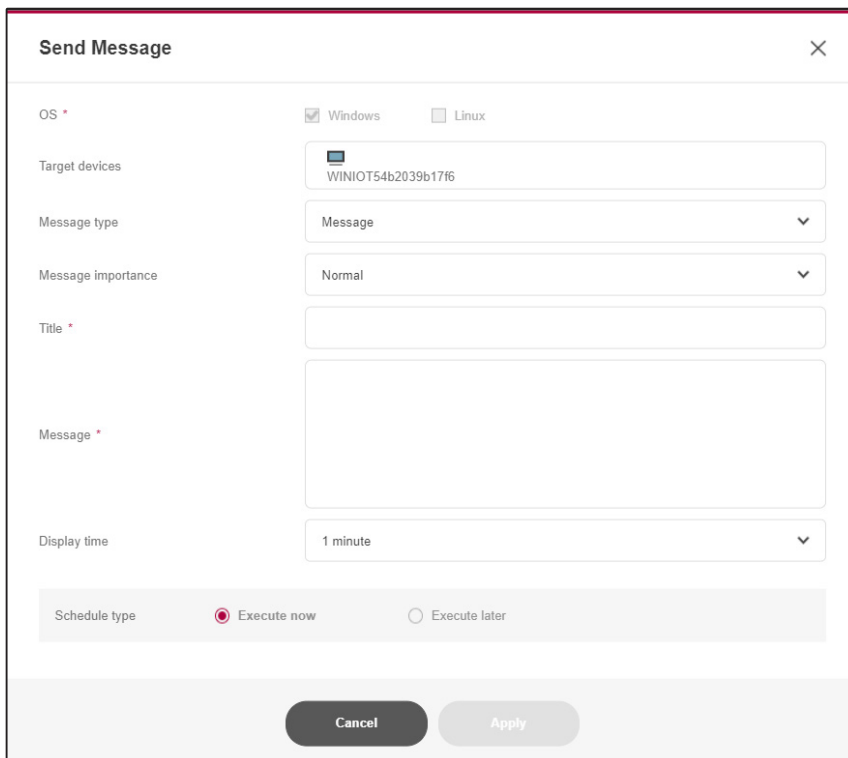

Only generic templates are shown in the list of templates, and package templates cannot be selected.

The 'Apply Template' dialog box features a title bar with a close button (X). Below the title bar, there are two radio buttons for 'OS': 'Windows' (selected) and 'Linux'. A warning icon and text ask, 'Are you sure you want to apply command template?'. Below this is a dropdown menu for 'Generic template' with the text '-- Select --'. Further down, there are two radio buttons for 'Schedule type': 'Execute now' (selected) and 'Execute later'. At the bottom, there are two buttons: 'Cancel' and 'Apply'.

[Send Message]

Administrators can send messages to devices in a group or to a specific device.

The 'Send Message' dialog box has a title bar with a close button (X). Below the title bar, there are two checkboxes for 'OS': 'Windows' (checked) and 'Linux'. Below this is a text field for 'Target devices' containing the value 'WINIOT54b2039b17f6'. There are two dropdown menus: 'Message type' with the value 'Message' and 'Message importance' with the value 'Normal'. Below these is a text field for 'Title'. A large text area for 'Message' is provided. Below the message area is a dropdown menu for 'Display time' with the value '1 minute'. At the bottom, there are two radio buttons for 'Schedule type': 'Execute now' (selected) and 'Execute later'. At the very bottom, there are two buttons: 'Cancel' and 'Apply'.

! NOTE

- When sending a message, up to 300 characters can be sent.

[Lock Computer]

Administrators can lock a device in a group or a specific device.

[Restart]

Administrators can restart a device in a group or a specific device.

[Shutdown]

Administrators can shut down the system of a device in a group or a specific device.

[Log Off]

Administrators can log off the system of a device in a group or a specific device.

[Wake On LAN]

Administrators can use the [Wake On LAN] function to power on a device in a group or a specific device. This function works even when the device is in Sleep mode, allowing it to wake up and become available for use. However, please note that the [Wake On LAN] function may not work depending on the network configuration. Additionally, the Mobile Thin Client (laptop type device) cannot be powered on while it is turned off, since it uses an external Ethernet gender.

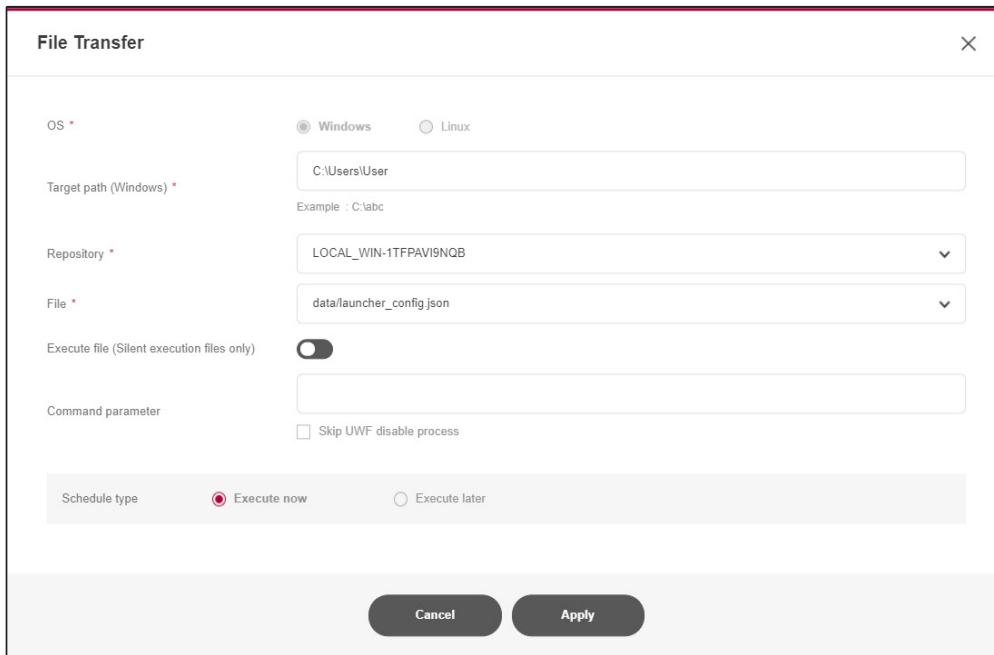

NOTE

For the device to function properly, it needs to have the same network address as the server and the switch should not restrict the broadcast. If you encounter any issues, please contact your network administrator for assistance.

[File Transfer]

Administrators can transfer files to a device in a group or to a specific device.

You can provide the path of the device to be transferred, specify the file, and apply the command parameter as needed.

The image shows a 'File Transfer' dialog box with the following fields and options:

- OS ***: Radio buttons for **Windows** (selected) and **Linux**.
- Target path (Windows) ***: Text input field containing 'C:\Users\User'. Below it, an example is shown: 'Example : C:\abc'.
- Repository ***: Dropdown menu showing 'LOCAL_WIN-1TFPAV19NQB'.
- File ***: Dropdown menu showing 'data/launcher_config.json'.
- Execute file (Silent execution files only)**: Toggle switch, currently turned off.
- Command parameter**: Text input field.
- Skip UWF disable process**: Checkbox, currently unchecked.
- Schedule type**: Radio buttons for **Execute now** (selected) and **Execute later**.
- Buttons**: 'Cancel' and 'Apply' buttons at the bottom.

[Execute file] you can activate it to automatically execute the file after completing the file transfer.

If [Skip UWF Disable process] is checked, the device will proceed to execute the file without the UWF deactivation process.

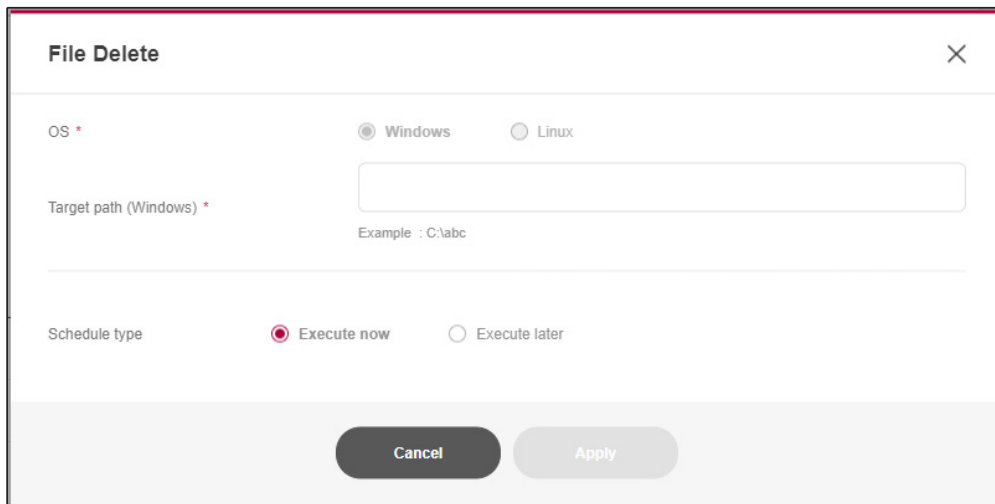

It is used for a one-time execution without leaving the file transferred to the device.

! NOTE

- In [Target path], you must enter the path of the folder name that exists on the device.

[File Delete]

Administrators can delete stored files on the device. You must enter the exact path and name of the file to be deleted.

The 'File Delete' dialog box features a title bar with a close button (X). Below the title bar, there are two radio buttons for 'OS': 'Windows' (selected) and 'Linux'. A text input field for 'Target path (Windows) *' is provided, with an example 'C:\abc' shown below it. At the bottom, there are two radio buttons for 'Schedule type': 'Execute now' (selected) and 'Execute later'. The dialog box has a 'Cancel' button and an 'Apply' button at the bottom right.

[Import File]

Administrators can import files saved on specific devices. Depending on the browser, the saving location of the imported file may vary.

! NOTE

- Since Linux devices are case-sensitive for file names, you can load the file normally only by entering the file name while distinguishing the upper or lower case of each character.

[SW & Patch Install]

Administrators can install software or patches on a device in a group or on a specific device. The software or patch to be installed must be saved in the server repository. Also, if you have saved the file to the server repository, you will need to run file synchronization to see it.

For file synchronization, see [Administration Settings] (⚙️) → [File Repository].

[SW & Patch Uninstall]

Administrators can remove software or patches from a device in a group or a specific device.

! NOTE

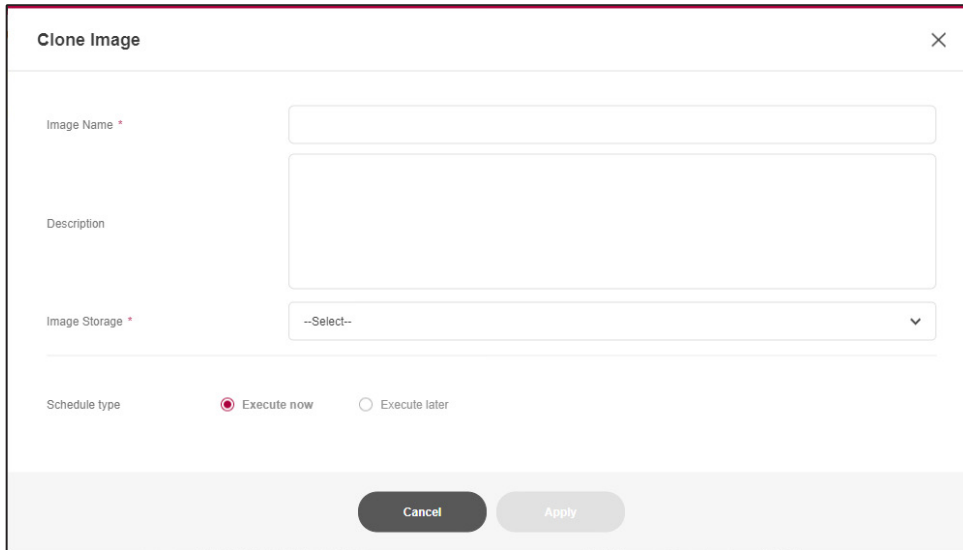

- For deletion, the name of the software to be deleted and the name of the software registered in the control panel must be the same to remove the software.

[Clone Image]

Administrators of LG Cloud Device Manager can clone the system image of a specific LG Cloud Device and deploy the image to that device and other devices. Image cloning is available from a single device.

How to clone the image

Select the device you want to clone the image from and select [Clone Image] in [More Actions].

A screenshot of the 'Clone Image' dialog box. The dialog has a title bar with 'Clone Image' and a close button (X). Inside, there are three main input fields: 'Image Name' with an asterisk, 'Description', and 'Image Storage' with an asterisk. The 'Image Storage' field is a dropdown menu currently showing '--Select--'. Below these fields, there is a 'Schedule type' section with two radio buttons: 'Execute now' (which is selected) and 'Execute later'. At the bottom of the dialog are two buttons: 'Cancel' and 'Apply'.

- [Image Name]: Specify the file name of the image to be cloned. The file will be stored in [Image Storage].
- [Image Storage]: You can choose the repository or the cache partition to store the cloned image. You can download the cloned image stored in the cache partition to the repository by [Pull Image].

! NOTE

- Please ensure that the power and wired network connection of the device are maintained to be ON while the image is being cloned.
- The cloned image is managed in [Administration Settings] (⚙️), [Cloned Images].
- When cloning an image, the items of the original device as shown below will be maintained when the image is generalized.
 - Windows: Computer name, installed SW, registry settings, network settings
 - Linux: Computer name, installed SW, network settings

[Deploy Image]

Administrators of LG CDM can deploy the system image of the reference device and distribute the image to other devices or device groups. Only deploy images that exist in the file repository or the device's image storage. If the [Deploy Image] task is not completed, it may not be displayed in the file list. At this time, check that the replication task has completed successfully and perform file synchronization of the file repository.

The P2P transmission is useful when deploying to multiple devices using remote repository.

This feature is only available with a valid license key.

[Push Image]

The administrator of LG CDM can deploy the system image cloned from a specific device to the cache partition of another device. The target of [Push Image] must be a single device or a single group.

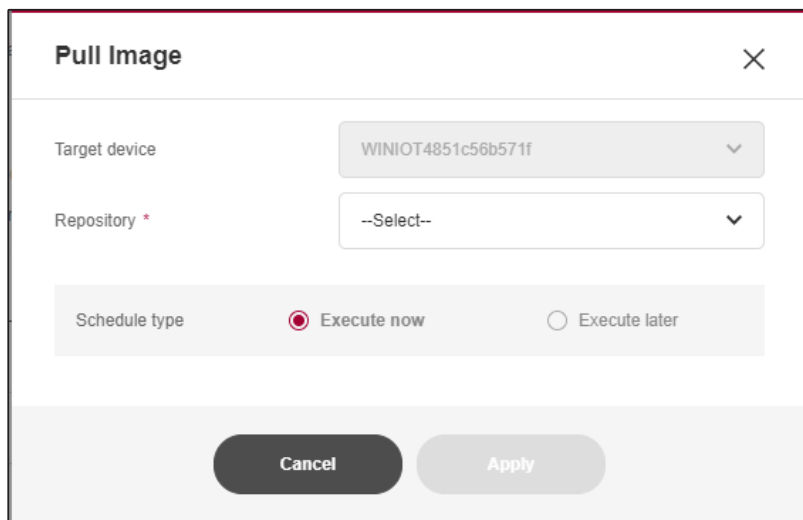

If the target device doesn't have Cache Partition, this task will fail.

The 'Push Image' dialog box features a title bar with a close button (X). It contains three input fields: 'Target device' with a dropdown menu showing 'WINIOT4851c56b571f', 'Repository *' with a dropdown menu showing '--Select--', and 'Image file *' with a dropdown menu showing '--Select--'. Below these fields is a 'Schedule type' section with two radio buttons: 'Execute now' (selected) and 'Execute later'. At the bottom are two buttons: 'Cancel' and 'Apply'.

[Pull Image]

The Administrators of LG CDM can request image from the device's Cache Partition. Pulled image is saved in the selected Repository.

The 'Pull Image' dialog box features a title bar with a close button (X). It contains two input fields: 'Target device' with a dropdown menu showing 'WINIOT4851c56b571f' and 'Repository *' with a dropdown menu showing '--Select--'. Below these fields is a 'Schedule type' section with two radio buttons: 'Execute now' (selected) and 'Execute later'. At the bottom are two buttons: 'Cancel' and 'Apply'.

! NOTE

- Please ensure that the power and wired network connection of the device are maintained to be ON while the image is being cloned.
- The cloned image is managed in [Administration Settings] (⚙️), [Cloned Images].

[Request Log File]

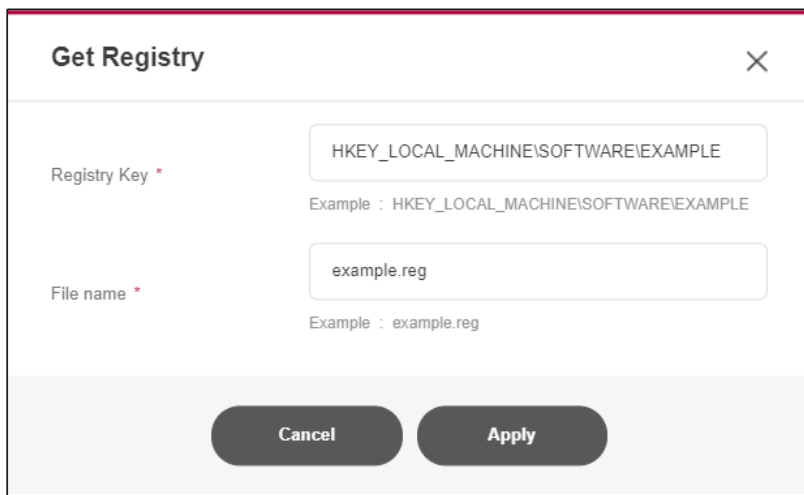

Administrators can request and import a log file of a specific device. The log file will be saved on the PC which operated the browser.

[Get Registry]

Administrators can request and import registry values of a specific Windows device. The registry requested is in key value units.

- [Registry Key]: Enter the registry key value to be imported.
- [File name]: Enter a file name to save the registry.

You can import a registry file of up to 20 MB, and the imported registry files will be saved in the browser's default storage location.

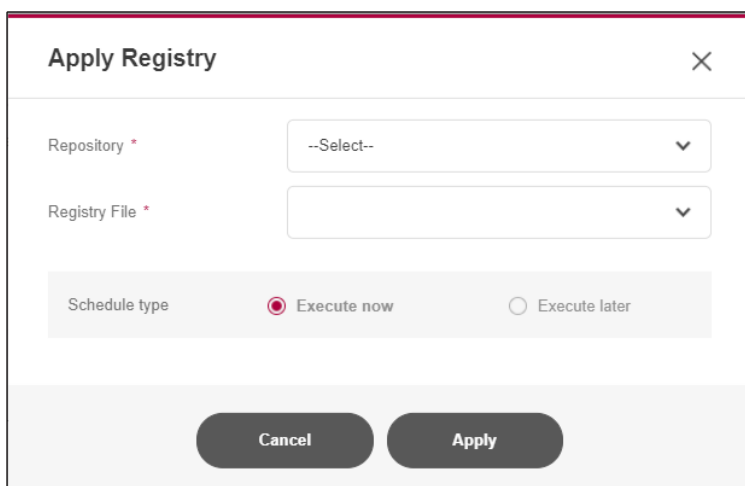

The 'Get Registry' dialog box features a title bar with a close button (X). It contains two input fields: 'Registry Key *' with the example 'HKEY_LOCAL_MACHINE\SOFTWARE\EXAMPLE' and 'File name *' with the example 'example.reg'. Below each input field is a smaller text line showing the example value. At the bottom, there are two buttons: 'Cancel' and 'Apply'.

[Apply Registry]

Administrators can apply registry values to a specific Windows device.

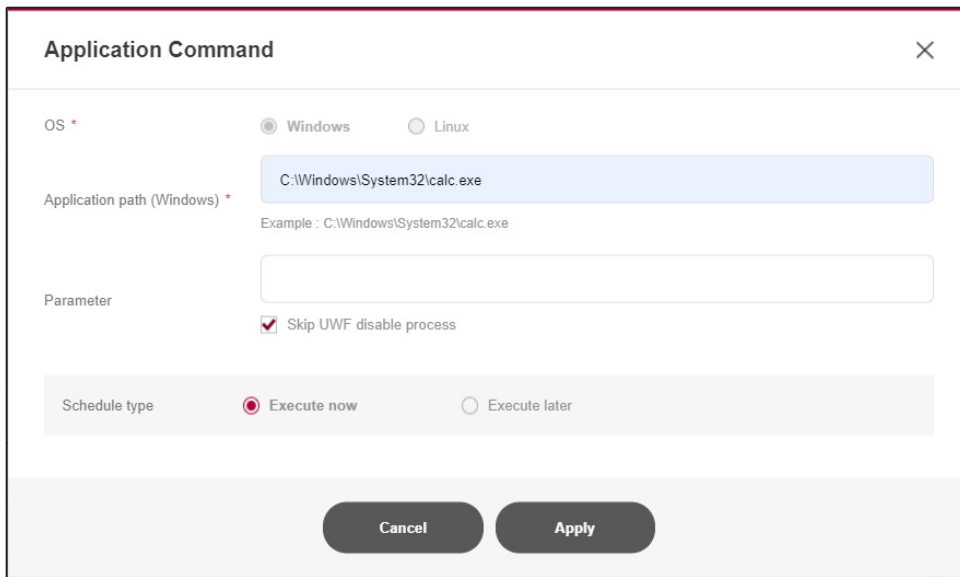

- [Apply Registry] can be applied to a single device or group.
- [Registry File]: Select the registry file to be applied among the registry files stored in the LG CDM repository.

The 'Apply Registry' dialog box has a title bar with a close button (X). It includes two dropdown menus: 'Repository *' with '--Select--' and 'Registry File *'. Below these is a 'Schedule type' section with two radio buttons: 'Execute now' (selected) and 'Execute later'. At the bottom, there are 'Cancel' and 'Apply' buttons.

[Application Command]

Administrators can run an application installed in a device in a group or in a specific device. Command parameters can be applied as needed.

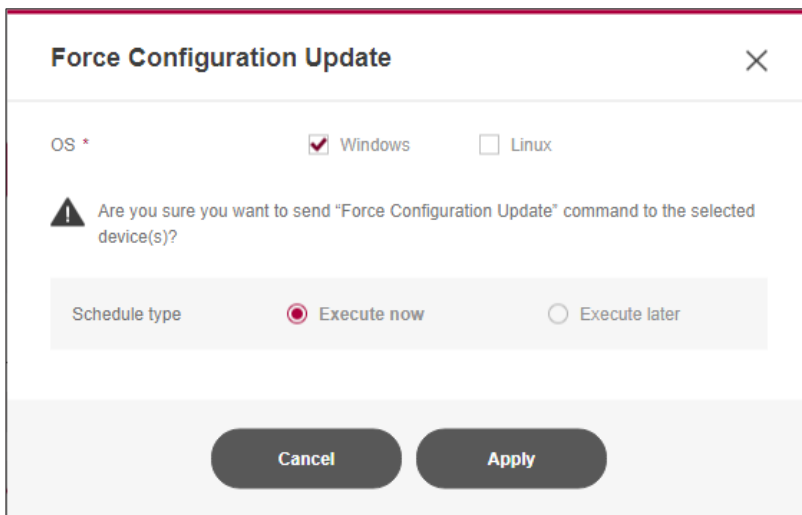

The 'Application Command' dialog box features a title bar with a close button (X). Below the title bar, there are two radio buttons for 'OS *': 'Windows' (selected) and 'Linux'. The 'Application path (Windows) *' field contains the text 'C:\Windows\System32\calc.exe', with an example text 'Example : C:\Windows\System32\calc.exe' below it. The 'Parameter' field is empty. A checkbox labeled 'Skip UWF disable process' is checked. The 'Schedule type' section has two radio buttons: 'Execute now' (selected) and 'Execute later'. At the bottom, there are 'Cancel' and 'Apply' buttons.

If [Skip UWF disable process] is checked, the device will proceed to execute the file without the UWF deactivation process.

It is used to execute the application only once on the device without leaving any settings.

[Force Configuration Update]

If the configuration status of LG CDM is different for a device in a group or a specific device, administrators can force it to match all devices.

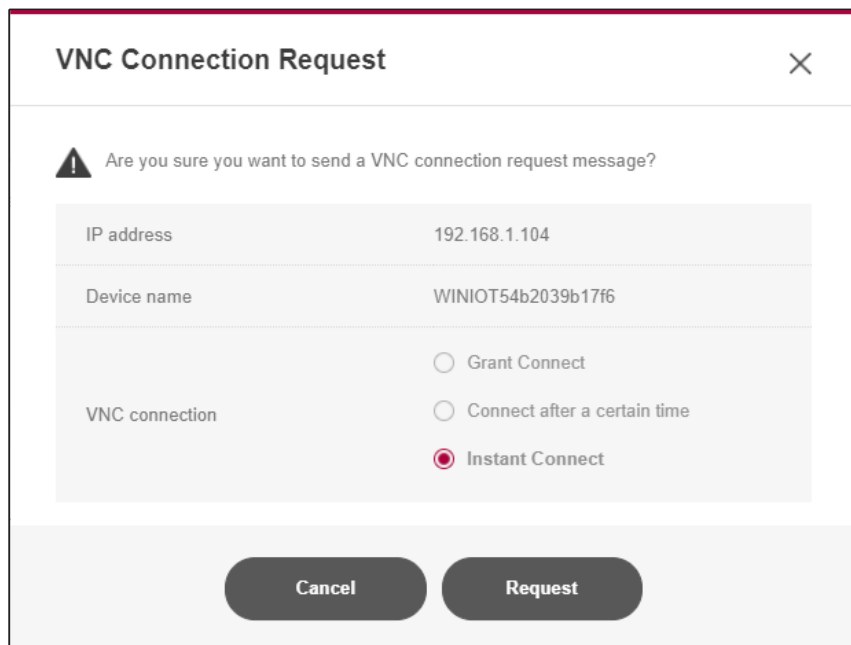

The 'Force Configuration Update' dialog box has a title bar with a close button (X). Below the title bar, there are two checkboxes for 'OS *': 'Windows' (checked) and 'Linux' (unchecked). A warning icon (triangle with exclamation mark) is followed by the text 'Are you sure you want to send "Force Configuration Update" command to the selected device(s)?'. The 'Schedule type' section has two radio buttons: 'Execute now' (selected) and 'Execute later'. At the bottom, there are 'Cancel' and 'Apply' buttons.

[Shadowing (VNC)]

Administrators of LG CDM can access LG Cloud Device through the [Shadowing (VNC)] function. The function to access LG Cloud Device may be affected by the network environment of the device. When the LG CDM administrator requests the [Shadowing (VNC)] function, the user of the target device will receive a pop-up message confirming the permission. If the user permits the shadowing, the VNC session will start.

! NOTE

- The default password for VNC connection is '@lgcdm'.

The image shows a 'VNC Connection Request' dialog box. At the top, it has a title bar with a close button (X). Below the title bar, there is a warning icon and the text 'Are you sure you want to send a VNC connection request message?'. The main content area contains a table with the following information:

IP address	192.168.1.104
Device name	WINIOT54b2039b17f6
VNC connection	<input type="radio"/> Grant Connect <input type="radio"/> Connect after a certain time <input checked="" type="radio"/> Instant Connect

At the bottom of the dialog box, there are two buttons: 'Cancel' and 'Request'.

- [Port No.]: Enter the [Port No.] defined by the VNC program of the target device.
 - The action after requesting VNC connection varies slightly depending on the VNC connection method (see [Administration Settings] (⚙️) → [General settings] → [VNC Connection]).
- [Grant Connect]: Connection will be made only if the device user has allowed it.
- [Connect after a certain time]: If the device user does not allow/cancel, the connection can be made after a certain time.
- [Instant Connect]: When requesting VNC connection, you can connect immediately without user permission.
- The VNC connection screen provides some special keys.
 - Alt+F4: Close the currently active program.
 - Alt+Tab: Switch tasks.
 - Ctrl+Alt+Del: Invoke Task Manager.
 - Alt Down: move up, scroll up, etc. (It may be different depending on the program you are using)
 - Alt Up: move down, scroll down, etc. (It may be different depending on the program you are using)

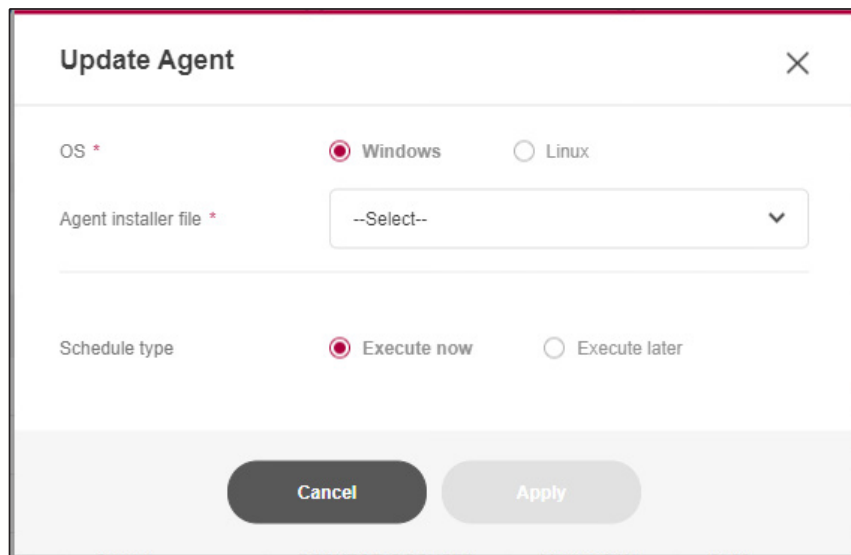

[Update Agent]

Administrators can update the agent for the device group or selected device. In order to update the agent for a device group or selected device, the corresponding agent must be available in the file repository and registered in the [Software Management] system.

Registration is described in Chapter 11.

If the agent installation file is not displayed, perform [File Sync] of file repository.

For file synchronization, see [Administrations Settings] (⚙️) → [File Repository]

The image shows a dialog box titled "Update Agent" with a close button (X) in the top right corner. The dialog contains the following fields and options:

- OS ***: Two radio buttons, "Windows" (selected) and "Linux".
- Agent installer file ***: A dropdown menu showing "--Select--" with a downward arrow.
- Schedule type**: Two radio buttons, "Execute now" (selected) and "Execute later".
- Buttons**: "Cancel" and "Apply" buttons at the bottom.

[Check Network Status]

If you suspect there is an issue with the device's network performance, such as unstable command arrival, you can check the device's network status.

Check Network Status

[Main]

Administrators using LG CDM can check the execution history of the tasks, including the time at which a specific command was generated, the type of task, the task result, and the ID of the administrator who started the task.

[Details]

In [Event Main] table, you can click icons in [More] column to go to [Details] of events. In [Details], you can view event Date, Owner, Type, Status, Target and Description.

Event Main

Details

Date	Owner	Type	Status	Target	Description
2022-02-11 16:40:51	lgcdm	Sync	Success	WIN-1TFPAV19NQB	
2022-02-11 16:40:33	DD0000000003	REPO_FILE_MOVE	Success	WIN-1TFPAV19NQB	

Filter Management

The function to search via event filtering: By designating a specific value to a specific column in the event list, you can see only the result that matches the specified value in a list.

Filter Items

- [Target]: You can select among [Group], [Device], [Repository], [System].
 - When you select [Group], the [Group] filter appears on the right and you can select a desired group from the [Group] filter.
 - When you select [Device], the [Device name] filter appears on the right, and you can search by entering the [Device ID] you want to search in the below [Device name] box.
 - When you select [Repository], the [Repository] filter appears on the right, and you can select the repository of your choice.
 - [System] TBD.
- [Owner]: Select the user of LG CDM.
- [Category]: You can search LG CDM for categories for administrative features.
- [Type]: It becomes enabled if you select an item from [Category]. You can select detailed items for administrative features.
- [Status]: You can search by selecting the status of the action performed by the administrator.
- [From] / [To]: You can set the administrator's working hours to search.

Apply Filter

After selecting a filter item, click the [Apply] button to display it in the list below.

Save Filter

You can save frequently used filters by clicking the [Save] button after selecting a filter item. When saving, enter [Name] and [Description]. When you finish saving, it appears as a name in [Saved filters] on the left.

You cannot save the filter if there is already a saved filter with the same options.

Using Saved Filters

Select the saved filter desired from the [Saved filters] list. The items of the selected filter are selected in the filter list. Click the [Apply] button to show them in the list below.

[Hide filters] / [Open filters]

You can see the [Hide filters]/[Open filters] buttons at the top right of the filter.

10. Task Management

The [Task Management] function displays detailed information about the tasks delivered to LG Cloud Device or a device group.

The LG Cloud Device administrators can view detailed information and check whether the task is in progress. Tasks are divided into [Summary] and [Detail]. [Summary] displays information by device group or task delivered to the device, and [Detail] displays information by each device.

	Date	Owner	Type	OS	Status	Result	Label	Event	Detail	Cancel
<input type="checkbox"/>	2023-02-27 11:29:55	lgcdm	Check Network Status	Windows, Linux	Completed	Success : 1, Failed : 0, Pending : 0, In-Progress : 0, Canceling : 0, Scheduled : 0, Skipped : 0, Delayed : 0, Canceled : 0, Postponed : 0				
<input type="checkbox"/>	2023-02-24 15:02:16	lgcdm	Request System Status	Windows	Completed	Success : 1, Failed : 0, Pending : 0, In-Progress : 0, Canceling : 0, Scheduled : 0, Skipped : 0, Delayed : 0, Canceled : 0, Postponed : 0				
<input type="checkbox"/>	2023-02-23 14:04:13	lgcdm	Shadowing (VNC)	Windows	Completed	Success : 1, Failed : 0, Pending : 0, In-Progress : 0, Canceling : 0, Scheduled : 0, Skipped : 0, Delayed : 0, Canceled : 0, Postponed : 0				

[Summary]

Displays information based on the task applied by the user.

Filter Items

- [Owner]: Select the user of LG CDM.
- [Type]: You can select the details of the task delivered to the device.
- [Label]: You can search by entering the group name of the applied device.
- [From] / [To]: You can search by setting the working hours of the task delivered to the device.

Items displayed in the list

- [Date]: Time when the task was set
- [Owner]: Users of LG CDM to which the task is applied
- [Type]: Details of the task. If you click a detailed item, you can go to [Detail] and check the information for each device.
- [OS]: OS to which the task is applied
- [Status]: Displays the status of the task. Displays as [Running], [Completed], etc.
- [Result]: Displays the results of the task. Displays the status of [Success], [Failed], [Pending], [In-Progress], [Canceling], [Scheduled], [Skipped], [Delayed], [Canceled], [Postponed]. When you click on the certain result from [Result], you can check details about that result.
- [Label]: If a task is assigned to a device group, the device group name is displayed in [Label].
- [Event]: You can move to the [Event] menu.
- [Detail]: Displays information in a pop-up window.
- [Cancel]: When the task can be stopped, the [Cancel] button is activated on the task list.

[Detail]

Displays information about the task by device. You can search through the [Status] entry in the filter, and you can see why the task failed.

Filter Items

- [Device]: You can search by entering the device ID.
- [Owner]: Select the user of LG CDM.
- [Type]: You can select the details of the task delivered to the device.
- [Status]: You can select the status of the task.
- [From] / [To]: You can search by setting the working hours of the task delivered to the device.

Items displayed in the list

- [Date]: Time when the task was set
- [Device]: Displays the [Device ID] to which the task has been applied.
- [Owner]: Users of LG CDM to which the task is applied
- [Type]: Details of the task. If you click a detailed item, you can go to [Detail] and check the information for each device.
- [OS]: OS to which the task is applied
- [Started on]: Displays the start time at which the task was applied to the device.
- [Ended on]: Displays the time at which the task was applied to the device.
- [Status]: Displays the status of the task. Displays the status of [Success], [Failed], [Pending], [Inprogress], [Canceling], [Scheduled], [Skipped], [Delayed], [Canceled].
- [Reason]: Displays the reason for the task's failure.
- [Event]: You can move to the [Event] menu.
- [Cancel]: When the task can be stopped, the [Cancel] button is activated on the task list.

Cancel Task

When the task can be stopped, the [Cancel] button is activated on the task list. The administrator can cancel the task by using this button.

11. Software Management

LG CDM can manage the Application to install and remove from the device. Manages the Installer of LG Cloud Agent, which is installed on the device for synchronization between LG CDM and the device. To manage each software, you must first copy the installation file to the 'apps' directory in the repository directory. The files copied to the directory above will be managed and configured as a list by LG CDM. (Refer to [File Management] on "12. Administration Settings" page)

- [OS]: Select the OS.
- [Repository]: Select the repository in which the application you want to add exists.
- [File]: Select the software to add. If you do not have the software, refer to [File Management] in "12. Administration Settings" to add the application.
- [Application]: Enter the administrative name of the software to be registered. It may be automatically entered when selecting the application from [File]. In the case of a Windows application, you'll need to write the name that appears in [Apps and Features] on Windows before [Uninstall] works.
- [Application name]: Enter a name to be displayed in the [SW & Patch Install] / [SW & Patch Uninstall] pop-up from [More Actions].
- [Version]: Enter the version information of the software.
- [Install parameter]: Enter the installing parameter. Enter it by referring to the software's help section.
- [Uninstall parameter]: Enter the uninstalling parameter. Enter it by referring to the software's help section.
- [Note]: Enter the content to be added.
- [Pre-Execution Script]: Add the script to execute before you install or delete the software. Able to add script by clicking the [Set] button.
 - [Repository]: Choose the file repository where the script is located
 - [File]: Choose the script that you want to execute
 - [Install parameter]: Set the install parameter
 - [Uninstall parameter]: Set the uninstall parameter
- [Post-Execution Script]: Add the script to execute after you install or delete the software. Able to add script by clicking the [Set] button.
 - [Repository]: Choose the file repository where the script is located
 - [File]: Choose the script that you want to execute
 - [Install parameter]: Set the install parameter
 - [Uninstall parameter]: Set the uninstall parameter

NOTE

- The silent option must be entered for normal installation/uninstallation of the application. Refer to Help in the application for silent option of the application. If there is an error in the parameter, it may not be installed/uninstalled normally.

Deleting applications

- You can delete applications from the [Application] list. When deleting multiple items, check the checkbox on the left of the list and use the [Delete] button at the top. To delete an item, use the delete icon on the right.

Installing applications

- You can install applications on the device. The [Installation] button on the right side of [Application] is performed in units of groups managed in [Device Manager]. Application installation is also available in the [SW & Patch Install] menu in [Device Manager]. If you check only one checkbox on the left of the list item, the [Install] button will be activated.

Uninstalling applications

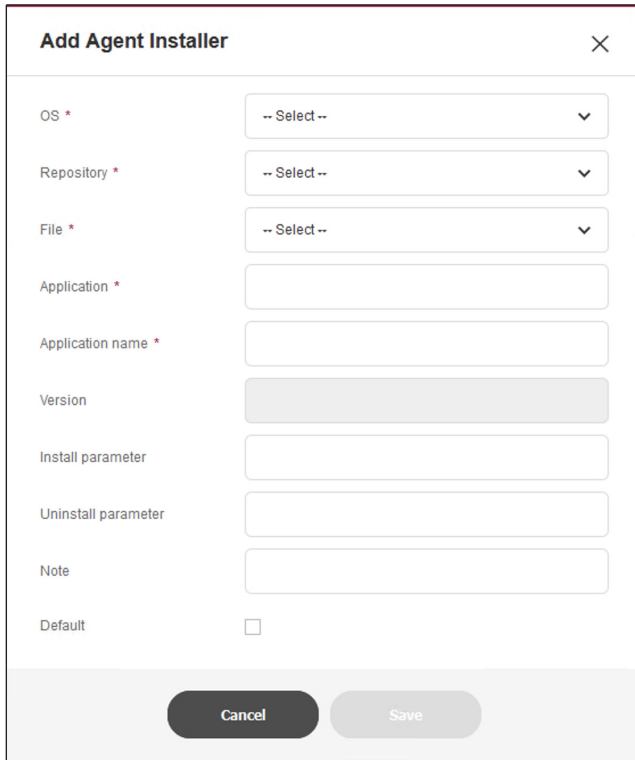

- You can uninstall applications installed on the device. The [Uninstall] button on the right side of [Application] is performed in units of groups managed in [Device Manager]. Uninstalling applications is also possible at the [SW & Patch Uninstall] menu in [Device Manager]. If you check only one checkbox on the left of the list item, the [Uninstall] button will be activated.
- In case of uninstalling the Application from the Window OS, the [Application name] on the CDM and the application name displayed on the [SW & Patch Install] must be the same.

[Agent Installer]

Manages the update software for the LG Cloud Agent. You must add it to the [Agent Installer] list to be able to use it in [Update Agent] in [More Actions].

Add agent

Click the [Add] button to add options for installing SW.

The 'Add Agent Installer' dialog box contains the following fields and controls:

- OS ***: A dropdown menu with the placeholder text '-- Select --'.
- Repository ***: A dropdown menu with the placeholder text '-- Select --'.
- File ***: A dropdown menu with the placeholder text '-- Select --'.
- Application ***: A text input field.
- Application name ***: A text input field.
- Version**: A text input field with a grey background.
- Install parameter**: A text input field.
- Uninstall parameter**: A text input field.
- Note**: A text input field.
- Default**: A checkbox.
- Buttons**: 'Cancel' and 'Save' buttons at the bottom.

- [OS]: Select the OS.
- [Repository]: Select the repository in which the application you want to add exists.
- [File]: Select the agent to add. If you do not have the software, refer to [File Management] in "12. Administration Settings" to add the application.
- [Application]: Registered as LG Cloud Agent.
- [Application name]: Enter a name to be displayed in the [Update Agent] pop-up in [More Actions].
- [Version]: Displays the version information of the software application.
- [Install parameter]: Enter '/S /v/qn'.
- [Uninstall parameter]: Uninstalling the agent through LG CDM is not available.
- [Note]: Enter the content to be added.
- [Default]: if checked it, you can only select the corresponding agent in the [Update Agent] of [More Actions].

Delete agent

- Uninstall it from the [Agent Installer] list. When deleting multiple items, check the checkbox on the left of the list and use the [Delete] button at the top. To delete an item, use the delete icon on the right.

12. Administration Settings

You can set the management functions of LG CDM.

☒

- [Device auto registration]: You can set whether to automatically register the device through the DHCP and DNS servers.
 - If the auto registration is on, the devices with group tokens will be automatically registered to belong to the corresponding group, and the devices without a group token will be registered under the default group.
- [File repository synchronization interval]: Set the file repository synchronization interval. Information in the [File Management] will be updated at the specified time interval.
- [Heartbeat interval]: Set the device's heartbeat interval. The device checks the device connection status through a heartbeat that is passed from the device to the LG CDM server.
- [Check in interval]: The time at which the status information is sent from the device to the server and the interval at which the task is checked will be changed to the set values.
- [Not checked in more than]: You can specify the maximum management period for devices that are not checked in. Devices that have not checked in for a set period of time will be displayed in the group dashboard.
- [VNC connection]: Set the VNC connection method.
 - [Grant Connect]: VNC connection is possible only when the device permits the connection.
 - [Connect after a certain time]: If the device does not allow/cancel, the connection can be made after a certain time.
 - [Instant Connect]: You can connect immediately without the device's permission.
 - [Allow the connection method change.]: If you enable this setting, you can select the VNC connection method in the [VNC Request] popup in [More Actions].
- [P2P deploy image]: Enables the P2P action when deploying images. You must enter a license key to display the [P2P deploy image] item.
- [P2P deploy file]: Enables the P2P action when deploying files. You must enter a license key to display the [P2P deploy file] item.

- [Storage free space is below]: Set the free space on the hard disk. If there is less free space than set, it will be displayed in [Notifications].
- [CPU Temperature is over]: Set the CPU temperature of the device. If the temperature is higher than the set temperature, it will be displayed in [Notifications].
- [CPU utilization exceeds beyond]: Set the CPU utilization of the device, and if the CPU utilization set in the device is exceeded, it will be displayed in [Notifications].
- [Memory usage exceeds]: Set the memory usage of the device, and if the memory usage set in the device is exceeded, it will be displayed in [Notifications].
- [CPU and RAM measurement interval]: Set the cycle for checking any excess in "CPU utilization" and "memory usage."

[DB Backup]

DB Backup

[Download backup file](#) Backup

Administrators can obtain the content of a DB with the function to download the backup file of LG CDM. You can back up the current settings by clicking [Backup] button.

DB restoration

You can restore the DB using the DB backup file.

1 Preparations

- Prepare the DB backup file
- Check the administrator ID and password of the DB entered when installing LG CDM
- Prepare a batch file for DB restoration You can ask LG Electronics Sale Engineers for the script files.

2 Sequence of the work

- Edit the Restore-lgcdm.bat using Notepad.
- Enter the following information correctly in Restore-lgcdm.bat:
SET RDB_USER_PWD =
- Execute Restore-lgcdm.bat in the folder where the DB backup file is located.

```
c:\LGCDM_V11_BACKUP\restore>restore.bat lgcdm-data-1585127100683.bak

<input type="checkbox"/>	DESKTOP-JU...	DESKTOP-JU...	REMOTE	online		2023-02-09 14...	0	0	Unregis..▼	⚙

- Unregister / Register file repository: You can unregister / register file repository in the [Register Status] item in the repository list. When you unregister the file repository, the files in the file repository become unavailable.
- [Delete]: Deletes the file repository from the list. You can only delete remote file repositories that have been unregistered. Deleted remote file repositories must be reinstalled before they can be used.
- [Add file]: You can add files to the file repository. Select the file repository to add the file to and click the [Add file] button.
- [Sync files]: Periodically refresh the list of files in the file repository for use by LG CDM. Performs forced synchronization to immediately reflect changes in the Apps and Data directories.
- [Setup]: You can modify the repository's name, as well as the maximum number of files (5/10/15/20/25) that can be downloaded simultaneously. The larger this number, the more impact can be put on the repository and network.
- [Authentication token]: An authentication token is required for using repositories. During the first installation of CDM, the authentication token is automatically applied to the local repository. For the remote repository, you can apply the authentication token during the installation of the Remote Repository. Please refer to the appendix for instructions on applying a new token to the repository.

- [File name]: Find the file to upload to the server on the PC you are using.
- [Type]: Check the file type. If the file and file type do not match, you cannot upload the file.
 - [Certificate]: User certificate (.pfx, .p12, .cer, .crt, .pem, etc.), up to 20 MB
 - [Background image]: Photo or image (.png, .x-png, .bmp, .jpg, .jpeg, .pjpg, .jpeg, .gif), up to 20 MB
 - [Windows Registry]: Windows registry (.reg), up to 20 MB
 - [Configuration]: [Smart Start] settings file (.json), up to 1 MB
 - [Icon]: Icon for shortcuts (.ico), up to 1 MB
 - [Application]: application installation files(.exe, .msi), up to 500 MB
- [Note]: Enter a description for the file.
- [Override existing file]: If there is a file with the same name, the file will not be added. Checking these settings will overwrite the same file.

! NOTE

- When adding files to the file repository, it is recommended that files be added directly to the built-in/remote file repository server.
- When adding files to the file repository, the patch file is added to the "apps" folder, the cloned images to the "images" folder, and other files to the "data" folder.
- After adding files to the file repository, running [Sync files] in [File Repository] allows you to view the file list in [File Management] and [Cloned Images].

[Repository Cluster]

In LG CDM, administrators can create a repository cluster, which is a repository that consists of at least one source repository and one or more repositories that work together and share files simultaneously to perform as a single repository. To create a repository cluster, select [Create Cluster].

The screenshot shows the 'File Repository' page with the 'Repository Cluster' tab selected. Under 'Cluster Management', there is an 'Operational status' section. It contains a message: 'To start configuring the cluster press the 'Create Cluster' button below and follow the instructions.' Below this message is a dark button labeled 'Create Cluster'.

[Create Cluster]

Step1. Source Repository

You can select the Source Repository. You can only choose the local repository as a source repository.

The screenshot shows the 'Create Cluster' dialog box with a progress bar at the top indicating six steps. Step 1, 'Source Repository', is the active step. The instructions state: 'Set the cluster name and choose a repository to use as the source repository.' There are two input fields: 'Cluster Name' with a text box containing 'Cluster Name', and 'Select Repository' with a dropdown menu showing '--Select--'. Below these fields are two buttons: 'Show Files' and 'Show Clone Images'. At the bottom of the dialog are 'Cancel' and 'Next' buttons.

- [Cluster Name]: Specify the name of the cluster.
- [Select Repository]: Select the source repository. You can only select the local repository as the source repository.
- [Show Files]: You can check files in the selected source repository.
- [Show Clone Images]: You can check OS images in the selected source repository.

Step 2. Files to Replicate

You can choose files from the source repository to be managed by the Repository Cluster.

Create Cluster

23456X

Step2. Files to Replicate

Choose files to be managed with cluster.
Files not selected are not available to use, but the files will not be deleted.

- [Replica Repositories]: Displays the information of replica repositories.
 - [Replica Repositories Name]: Displays the name of replica repositories.
 - [Status]: Displays whether the repository is online/offline.

[Device Assignment]

You can deploy files by assigning a priority repository to devices. If the Repository Cluster fails to deploy the file through the priority repository, files will be deployed through the source repository. You can choose between [Device Group] and [Subnet] to assign devices to the priority repository.

[Device Group]

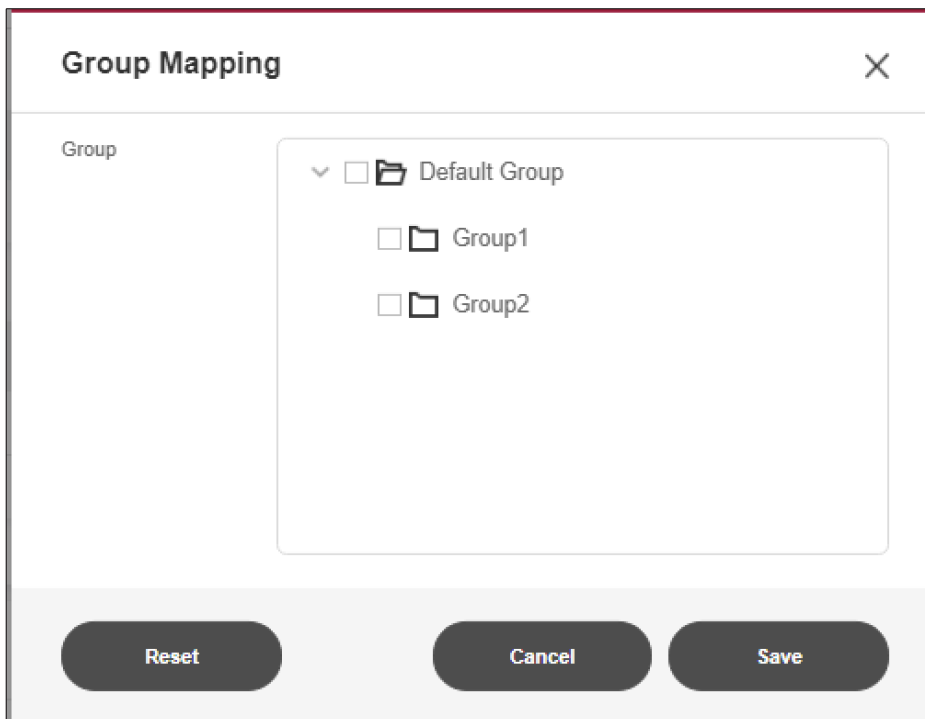

You can assign the device(s) to the priority repository by Device Group.

The screenshot shows a window titled "Device Assignment". At the top, there are two radio buttons: "Device Group" (which is selected) and "Subnet". Below this is a table with two columns: "Replica Repository Name" and "Device Group". The table contains two rows of data.

Replica Repository Name	Device Group
DESKTOP-F4DAJRR	0 Group
WIN-J0I9786MED4	0 Group

From the [Device Group] column, click "0 Group" to assign the Device Group.

The screenshot shows a dialog box titled "Group Mapping" with a close button (X) in the top right corner. Inside the dialog, there is a section labeled "Group" on the left. To the right of this label is a list of groups, each preceded by a checkbox and a folder icon. The groups are "Default Group", "Group1", and "Group2". At the bottom of the dialog, there are three buttons: "Reset", "Cancel", and "Save".

Check the Device Group to be assigned.

[Subnet]

You can assign the device(s) to the priority repository by subnet range.

Device Assignment

Assign to :

[Active Directory]

You need to register with the AD server to manage AD accounts as users of LG CDM.

Register AD Server

Name *

Domain *

Server URL *

Port *

Context-Base *

Verify

- [Name]: Enter the name of the AD server to be registered.
- [Domain]: Enter the domain of the AD server to be registered.
- [Server URL]: Enter the AD server URL that is in the form of "ldap://".
- [Port]: Enter the port of the AD server.
- [Context Base]: Enter the type of AD account to be used in LG CDM.

[User]

Set up an administrator account for LG CDM. Create user groups and users to manage the users.

[User group]

You can create and manage user groups. The privileges of the administrator account are [Administrator], [Full access], [Read], [No access], and [Customized].

User User Group				
<div>Add user groupDelete</div>				
<input type="checkbox"/>	User group	▼ User role	Edit	Delete
<input type="checkbox"/>	Full_Access	Full access		
<input type="checkbox"/>	Admin Group	Administrator		

- [Administrator] group has authority over the [Administration Settings] (⚙️) menu and has no restrictions on the setting and use of LG CDM.
- [Full access] group cannot access the [Administration Settings] (⚙️) menu but has no restrictions on the setting and use of LG CDM.
- [Read] has no authority to change settings, and can only check the setting values.
- [No access] is used to create an account that cannot sign in, without deleting the account.
- [Customized] group does not have permission to access the [Administration Settings] (⚙️) menu, and the settings and usage restrictions of LG CDM follow the [Base role]. Additionally, you can set individual access permissions for each device group and execution permissions for each command.
 - A group with a [Full access (custom)] base role has no restrictions on the settings and usage of LG CDM. However, the group cannot execute commands for which permissions have been excluded through the [Command] menu.
 - A group with a [Read (custom)] base role cannot change LG CDM settings but can view the settings values. The group can execute commands that have been granted permissions through the [Command] menu.
 - If you select [Read (custom)] for [Base role], the checkbox for [Apply command to single device only] will appear. When the checkbox is selected, you cannot apply a command to group or multiple devices. It can only be applied to a single device.

Description

Cancel

Save

In addition, you can edit user information, and configure detailed settings for [AD authentication], [Lockout], [Allow direct access to file repository], [Notifications], and [Email notifications].

The image shows a web form titled "Edit User" with a close button (X) in the top right corner. The form contains several input fields and toggle switches. The "User group" is a dropdown menu set to "devel_custom". The "Email" field is a text input containing "lest1@lge.com". The "First name" field contains "Monica" and the "Middle name" field is empty. The "Last name" field contains "Kim". There are five toggle switches: "AD Authentication" (off), "Locked" (off), "Allow Direct Access to File Repository" (off), "Notification" (on), and "Email notification" (off). Below these are three text input fields: "Password", "Confirm password", and "Mobile number". The "Password" and "Confirm password" fields have eye icons for toggling visibility. At the bottom is a large text area labeled "Description". At the very bottom are two buttons: "Cancel" and "Save".

You can also delete accounts. But you cannot delete your own account that has been logged in.

[Reports]

It provides the ability to check the usage history of LG CDM by creating a CSV file.

Select [Type] of the report and specify [Group]. You can specify [Period] if necessary.

If [All Devices], [New Devices], [No Check-in], [Write filter off], or [Compliance status conflict] are selected in [Type], then [Period] cannot be set because the report is about the device status.

When created, the item will appear in the list. If the file is large, it may not be displayed immediately or it may appear as a temporary file, so please click the [Refresh] button at the top.

13. Refer to the port

Target	Module	Direction	Protocol	Port number
Server	LG CDM	In-bound	TCP	443
	Message Broker	In-bound	TCP	5672
	VNC Relay	In-bound	TCP	55901
Device	VNC	In-bound	TCP	5900
	-	In-bound	TCP	6900
	-	In-bound	UDP	53615

Appendix A: How to use the Wireless Profile Export Tool

The wireless profile files, extracted from the devices using Wireless Profile Export Tool, can be imported and applied as a configuration. Such imported wireless profile have higher priority than custom profiles.

The screenshot shows the 'Default Group' settings window with the 'Network Setup' tab selected. Under the 'Wireless' sub-tab, there is a section for 'Wireless profile 1'. It includes a search bar with a magnifying glass icon and a plus sign button to add a profile. Below this, there is a note: 'Imported wireless profiles take priority over custom profiles.' At the bottom, there is a 'Computer Name' section with a dropdown menu for 'Computer name type' currently set to '-- Select --'. The window has buttons for 'Reset all', 'Withdraw', 'Cancel', and 'Save' at the bottom.

This screenshot shows the same 'Default Group' settings window, but with a 'Browse Files' dialog box open in the foreground. The dialog box has two dropdown menus: 'Repository Name' and 'File name', both currently set to '--Select--'. At the bottom of the dialog are 'Cancel' and 'OK' buttons. The background settings window is dimmed, showing the same 'Wireless' configuration options as the previous screenshot.

You can browse repositories and select .cdff files that you want to import to the configuration.

Exporting Wifi profile from device

[Windows]

1.Run "wireless_export_to_cdff.ps1" script in command prompt:

- a. To export all Wifi profile:
 > powershell -f wireless_export_to_cdff.ps1 -out [target directory]
- b. To export Wifi profile by SSID:
 > powershell -f wireless_export_to_cdff.ps1 -out [target directory] -ssid [profile ssid]
- c. To export Wifi profile by name:
 > powershell -f wireless_export_to_cdff.ps1 -out [target directory] -name [profile name]

```
C:\Users\Admin\Desktop> powershell -f wireless_export_to_cdff.ps1 -out C:\Users\Admin\Desktop\LGCloudAgent
profile name : lee, SSID : louis_5g
profile name : louis_2.4G, SSID : louis_2.4G
profile name : louis_5G, SSID : louis_5G

C:\Users\Admin\Desktop> powershell -f wireless_export_to_cdff.ps1 -out C:\Users\Admin\Desktop\LGCloudAgent -name lee
profile name : lee, SSID : louis_5g

C:\Users\Admin\Desktop> powershell -f wireless_export_to_cdff.ps1 -out C:\Users\Admin\Desktop\LGCloudAgent -ssid louis_5g
profile name : louis_5G, SSID : louis_5G

C:\Users\Admin\Desktop> powershell -f wireless_export_to_cdff.ps1 -out C:\Users\Admin\Desktop\LGCloudAgent -ssid louis_5g -name louis_2.4G
profile name : louis_2.4G, SSID : louis_2.4G
```

[Linux]

Usage: ./export_wireless_profile [option] ...

options:

- a, --all: Create all wireless profile
- s, --ssid: SSID name
- c, --connection_name: connection name
- o, --outpath: created out directory // Mandatory

1. Run Terminal in "export_wireless_profile" directory:

- a. To export all Wifi profile:
 > ./export_wireless_profile -a -o [target directory]
- b. To export Wifi profile by SSID:
 > ./export_wireless_profile -s [profile ssid] -o [target directory]
- c. To export Wifi profile by name:
 > ./export_wireless_profile -c [connection name] -o [target directory]

Appendix B: Postpone task execution on devices

After entering the license key, you can use [Administration Settings] tab in [Configuration]. In [Postpone Task Execution] menu of [Administration Settings] tab, you can set [Allow postpone] and [Postpone time] of postpone task execution.

The screenshot shows the 'Default Groups' configuration window with the 'Administration Settings' tab selected. Under the 'Postpone Task Execution' section, the 'Allow postpone' option is set to 'Yes' and the 'Postpone time' is set to '120 minutes'. A note below these settings states: 'Note: Postpone task execution can be done at maximum twice as selected postpone time.' At the bottom of the window, there are buttons for 'Reset', 'Reset all', 'Withdraw', 'Cancel', and 'Save'.

By enabling the [Allow postpone] option, device users will be able to choose to postpone the execution of certain LG CDM commands listed below:

- Move Group / Move Device
- Apply Template
- Lock Computer
- Restart
- Shutdown
- Logoff
- File Transfer
- File Delete
- SW & Patch Install / SW & Patch Uninstall
- Clone Image / Deploy Image
- Apply Registry
- Application Command
- Update Agent

When one of the above commands is executed, Cloud agent installed on devices causes a pop-up where you can choose to postpone or immediately execute the task.

The screenshot shows a 'Notice' dialog box with the following text: 'The action specified by the manager will be in progress. Device reboot is required while the operation is in progress. Do you want to run it now?'. A timer '00:03:30' is displayed. At the bottom, there are two buttons: 'Postpone' and 'Apply now'.

If the device user selects “Apply now”, the command is executed immediately.
If the device user selects “Postpone”, another pop-up to set the postpone time occurs, and the task can be postponed up to 2 times within [postpone time] set in CDM Configuration settings.

Task Postpone (1/2)

i

Set the time time to postpone.

Minute 10

Cancel

OK

Task Postpone (2/2)

i

Set the time time to postpone.

Minute 10

Cancel

OK

Devices that have postponed task execution can be viewed in dashboard of Device Manager or Devices menu.

Appendix C: How to set up a new authentication token to reuse the file repository

The CDM server uses authentication tokens to verify the file repository.

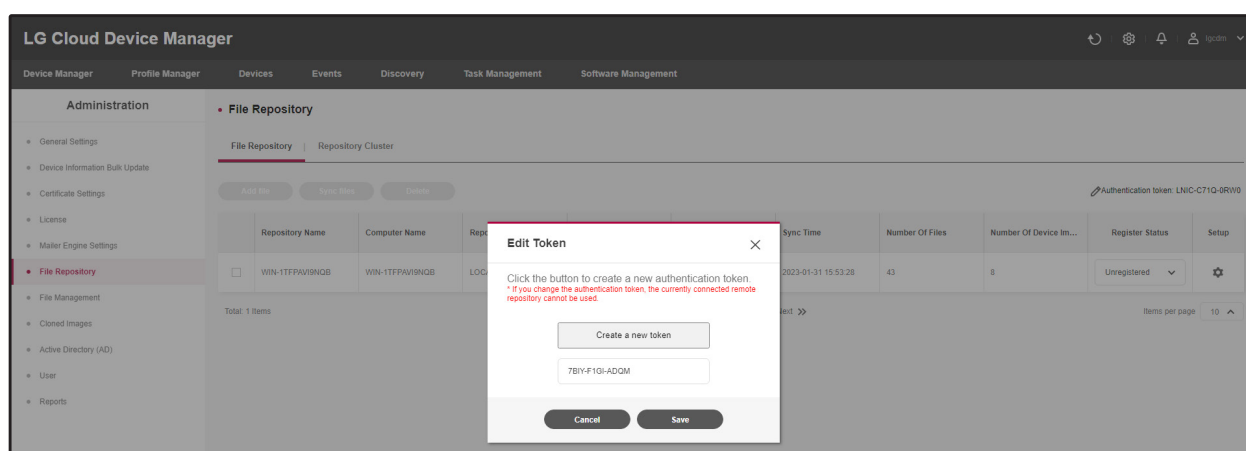

If for any reason the authentication token of the CDM server is changed, the file repositories are no longer available.

How to set up a new authentication token to reuse the file repository is described below.

If you have already changed the authentication token, proceed from Step 2.

Step 1. Regenerate a [Authentication token].

- 1) Go to [Administration Settings] → [File Repository].
 - 2) Click the [Edit] button.
 - 3) Click [Create a new token] in the [Edit Token] pop-up, and click [Save].
- ※ A license key is required to change the authentication token.

Step 2. Encode the generated token.

- 1) Access the token encoding website. (<https://www.base64encode.org/>)
- 2) Enter a new token.
- 3) Click [Encode].
- 4) Check the encoded token value.

Encode to Base64 format
Simply enter your data then push the encode button.

LJ3Q-13D7-JG76

ⓘ To encode binaries (like images, documents, etc.) use the file upload form a little further down on this page.

UTF-8 Destination character set.

LF (Unb) Destination newline separator.

☐ Encode each line separately (useful for when you have multiple entries).

☐ Split lines into 76 character wide chunks (useful for MIME).

☐ Perform URL-safe encoding (uses Base64URL format).

☒ Live mode OFF Encodes in real-time as you type or paste (supports only the UTF-8 character set).

> ENCODE < Encodes your data into the area below.

TEozUS0xM0Q3LUpHNzY=

Step 3. Apply the encoded token to the configuration file of the file repository.

1) Go to the CDM installation path.

The default installation path is "C:\Program Files\LG CDM\".

2) Open the <Install Path>\conf\wservice\repository-service.properties file with an editor.

3) Enter the new encoded token to api_service.device_token and then save.

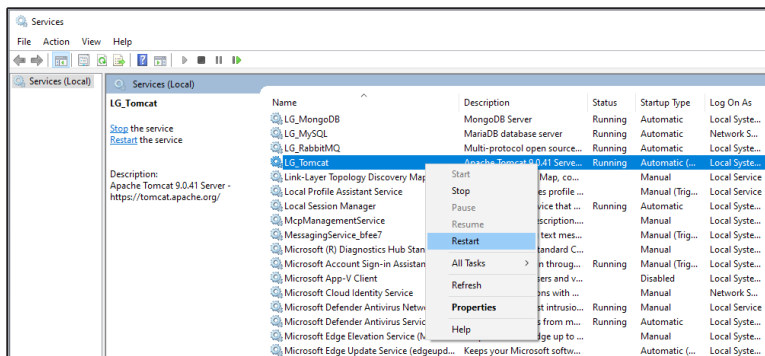

※ If there is a remote file repository, proceed the same steps 1) to 3) on that machine.

```
repository-service.properties
1
2
3 spring.cache.jcache.config=classpath:ehcache.xml
4
5
6
7 repository.resource.file.extensions.background_image=jpg,jpeg,bmp,png,gif
8 repository.resource.file.extensions.certificate=pfx,p12,cert,crt,pem,key
9 repository.resource.file.extensions.windows_executable=exe,msi,msu
10 repository.resource.file.extensions.linux_package=deb
11 repository.resource.file.extensions.configuration=json
12 repository.resource.file.extensions.windows_registry=reg
13 repository.resource.file.extensions.icon=ico
14 repository.resource.file.extensions.cdff=cdff
15
16 repository.purge.directory=apps,data,images,temp
17
18
19
20 api_service.host=https://127.0.0.1
21
22
23
24 api_service.device_token=TE5JQy1DNzFRLTBSVzA=
25
26
27
28 repository.host=https://192.168.1.199
29
```

Step 4. Restart the file repository service.

1) Go to Service. (Win+R, services.msc)

2) Restart the LG_Tomcat.

Appendix D: Server-less Self-diagnosis of LG Cloud Agent

LG Cloud Agent's server-less self-diagnosis verifies the operating environment of the agent and reports the result.

Mainly tests [Configuration] items. A network connection must be established, but CDM server connection is not essential. (Agent can be performed alone)

It doesn't do anything that requires a file download. (certificate setting, wallpaper setting, etc.)

How to perform self-diagnosis

- 1) Right-click the Cloud Agent icon in the device system tray, and run Self-Diagnosis.
- 2) Enter Admin account and its password.
- 3) Start Self-Diagnosis (Do not turn off the power or input keyboard/mouse during diagnosis).
- 4) Check Self-Diagnosis result. (View Result)
- 5) Create Self-Diagnosis report (Export Result)

Appendix E : How to use WebDAV client for access the file repository

Introducing WebDAV.

Web Distributed Authoring and Versioning (WebDAV) is an extension of the Hypertext Transfer Protocol (HTTP) that allow collaboration between users in editing and managing documents and files stored on web servers.

Introducing WinSCP (WebDAV client).

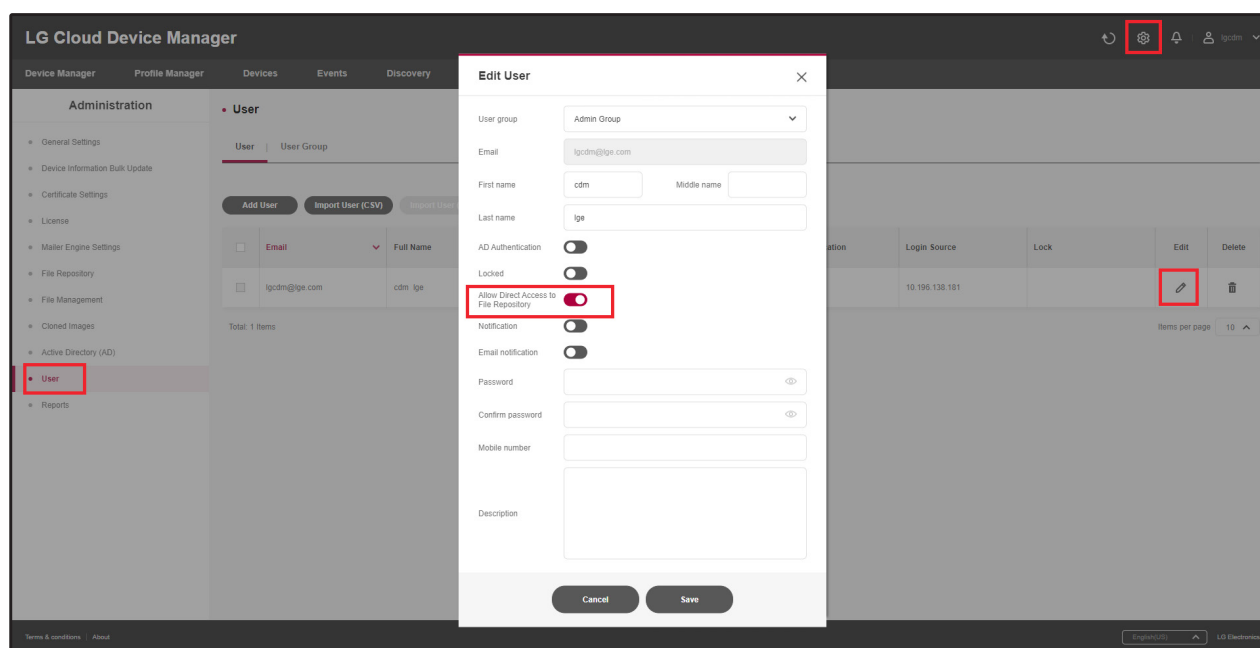

WinSCP is an open source free SFTP client, FTP client, WebDAV client, S3 client and SCP client for Windows. Its main function is file transfer between a local and a remote computer. Beyond this, WinSCP offers scripting and basic file manager functionality.

WinSCP Download and Install.

<https://winscp.net/eng/download.php>

How to use.

- 1) Move to Administration > User > Edit User.
- 2) Enable "Allow Direct Access to File Repository".
- 3) Run WinSCP and login.
 - A. Protocol: WebDAV
 - B. Host name: `https://{repository_server_IP}/file-repository-service/root`
 - C. User name: Admin account (ex:lgcdm)
 - D. Password: CDM password of admin account
- 4) Upload files to use (move file from left panel to right panel).
- 5) Administration > File Repository > [Sync files] click, then the file can be available

Appendix F: LG CDM Update Troubleshooting Guide

This guide lists common problems faced during the update and a way to solve them.

1. Fail to process DB Backup.

Generally, this error occurs when MongoDB is empty or has no necessary schema for backup. This can be solved by saving one or more apps in LG CDM > [Software Management]. When you click [OK] on the prompt, the installer will terminate as it is considered a critical failure. Please follow the steps below after installer is terminated.

- i. Find "Invalid namespace specified 'TCMS.'" log in installer.log located in LG CDM installation directory. (See the figure below)
 - Default LG CDM installation directory: C:\Program Files\LG CDM\

```

=====
Data Backup - MariaDB, MongoDB
=====
Install Dir = C:\Program Files\LG CDM
Backup Dir = C:\ProgramData\LG Software\LG CDM\LGCDM
MariaDB Id = lgcdm
MariaDB Password = *****
MariaDB Backup = cdm-mariadb.bak
MongoDB Id = lgcdm
MongoDB Password = *****
MongoDB Backup = cdm-mongodb.bak.zip
Starting LG_MySQL ...
The LG_MySQL service is starting.
The LG_MySQL service was started successfully.

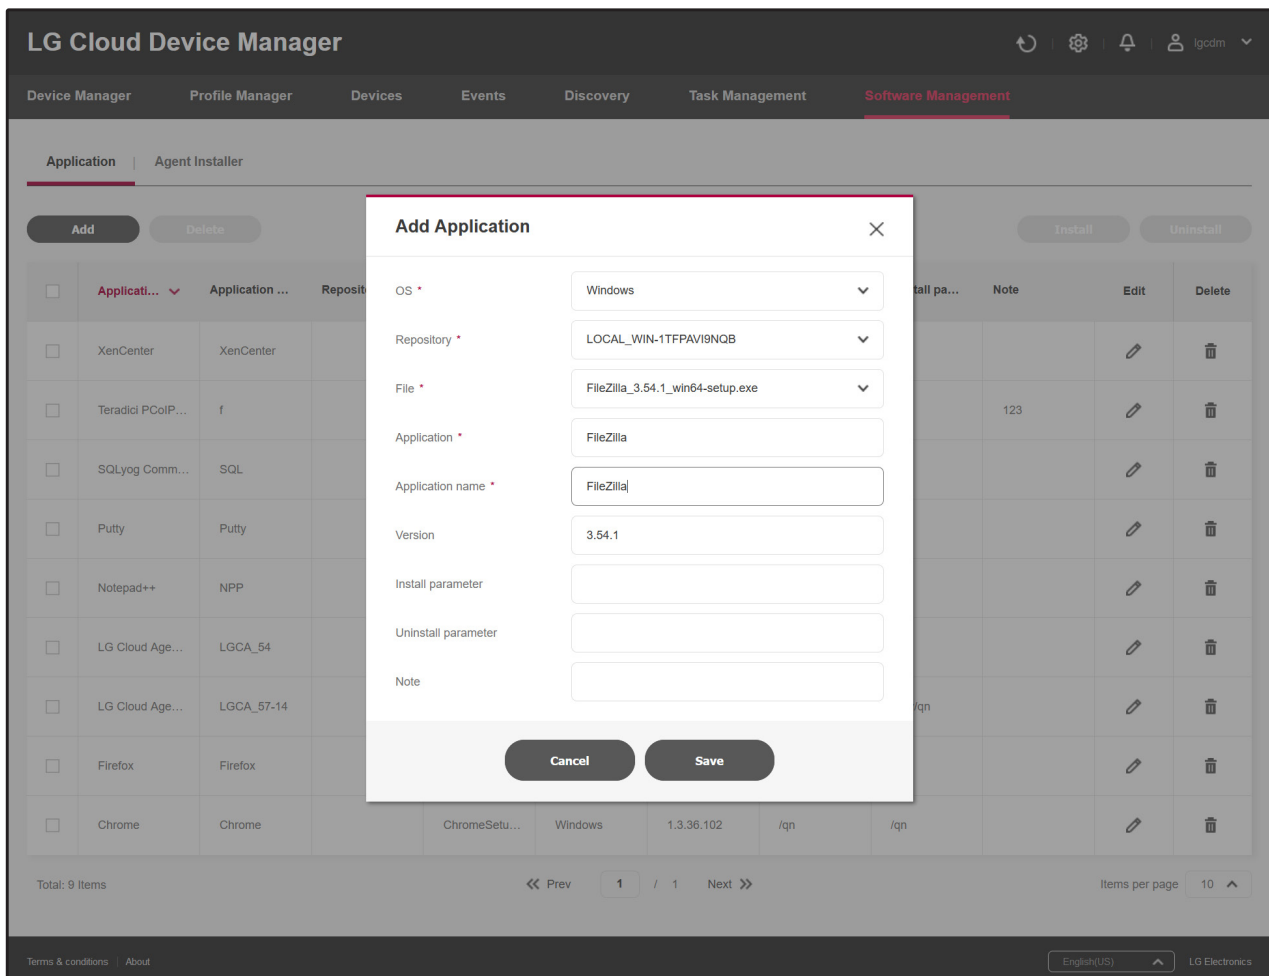

mariaDB data dump - success
backup mariaDB : success
Starting LG_MongoDB ...
The LG_MongoDB service is starting.
The LG_MongoDB service was started successfully.

"DESKTOP-00FFH70"
2022-07-14T13:45:59.948+0900 Failed: error counting TCMS.: Invalid namespace specified 'TCMS.'
mongoDB data dump - failure
[7-14-2022] [13:46:00] <JHBackupDataBase(2157)> :: Fail to process DB Backup.

```

- ii. Restart following LG CDM services:
 - LG_MongoDB
 - LG_MySQL
 - LG_RabbitMQ
 - LG_Tomcat
- iii. Put one or more apps (*.exe) in %LG CDM File Repository%\apps\ directory.
 - Default LG CDM Repository directory: C:\LG CDM File Repository\.
- iv. Log in LG CDM > Administration Settings > File Repository > Select the local repository and click Sync files.

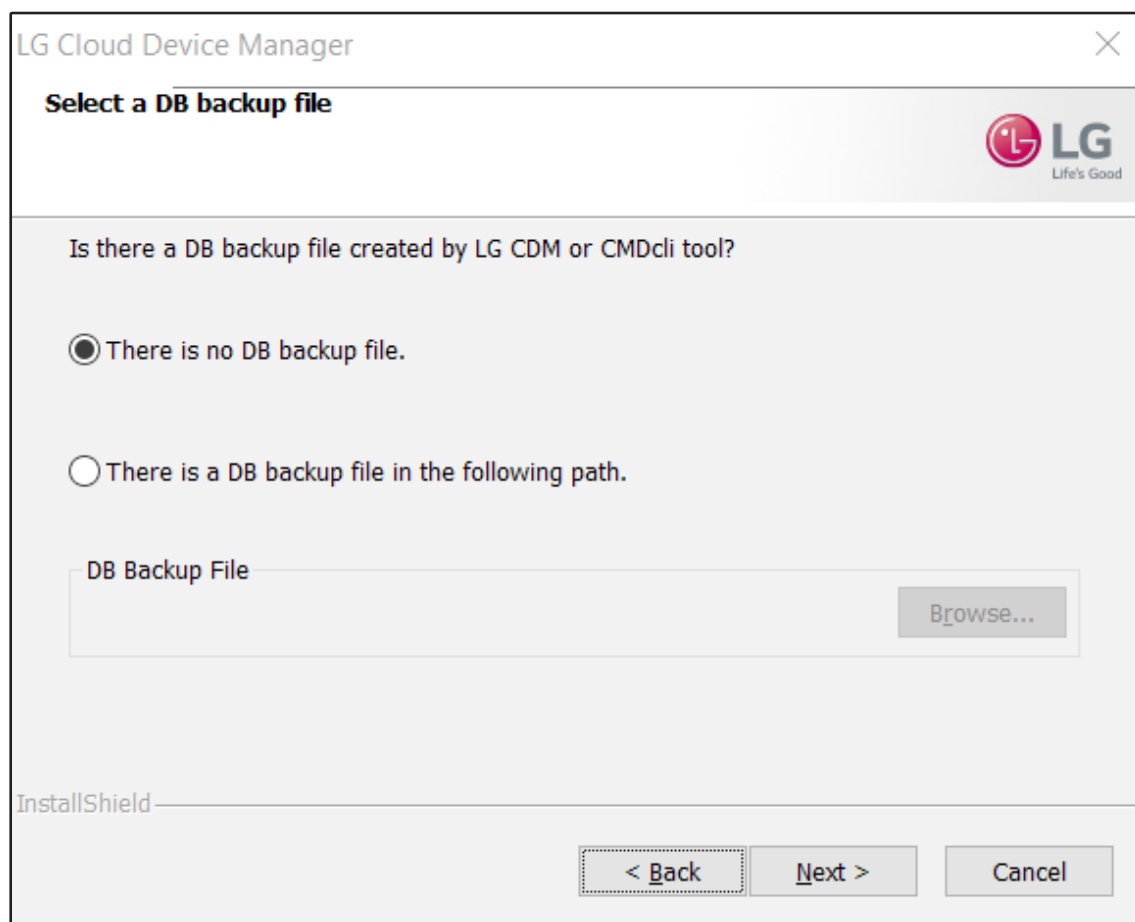

- v. Go to Software Management > Application > Add > Add the app(s) that you put the local repository %LG CDM File Repository%\apps\w directory in (iii). (See the figure below)
- vi. Run CDM 3.1 installer executable to retry LG CDM Update.

2. RabbitMQ, MySQL, MongoDB setup config Failed.

In this case, the LG CDM Update will fail and the installer will proceed to revert the process. After the reversion is completed, the remaining files and registry keys should be completely deleted by further proceeding the followings.

- i. Windows Registry Editor > Delete the key:
HKEY_LOCAL_MACHINE\SOFTWARE\Ericsson\W Erlang\W ErlSrv\1.1\WG_RabbitMQ
- ii. Windows Resource Monitor > kill empd.exe process if exists.
- iii. Stop & delete all LG CDM services listed previously.
- E.g., Windows CMD > sc stop LG_MongoDB | sc delete LG_MongoDB
- iv. Run old installer executable to remove old LG CDM from the system completely.
- v. Once the old LG CDM is removed, run new LG CDM 3.1 installer executable to proceed fresh installation.
During the installation process, you can choose [There is a DB backup file in the following path] and locate the database backup file in [Select a DB backup file] installation page to restore the database while installing the new LG CDM. (See the figure below)
- Default DB Backup file directory: C:\ProgramData\WG Software\WG CDM\WGCDM\

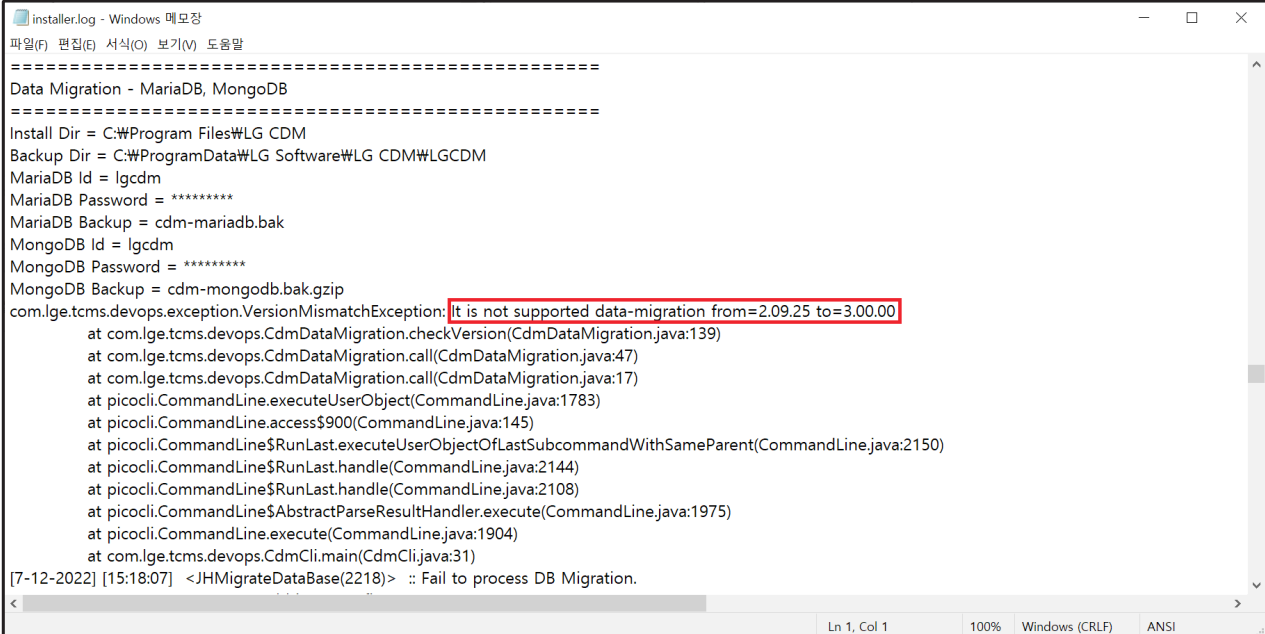

The screenshot shows a window titled "LG Cloud Device Manager" with a close button in the top right corner. Below the title bar is a header section with the text "Select a DB backup file" and the LG logo (a red circle with a white 'L' and the text "LG Life's Good"). The main area of the window contains the question "Is there a DB backup file created by LG CDM or CMDcli tool?". There are two radio button options: "There is no DB backup file." (which is selected) and "There is a DB backup file in the following path." Below the second option is a text input field labeled "DB Backup File" and a "Browse..." button. At the bottom left of the window is the "InstallShield" logo. At the bottom right are three buttons: "< Back", "Next >", and "Cancel".

3. Could not restore Database from the backup...

This error occurs when the new (currently installing) LG CDM attempts to restore the database from a backup file of incompatible LG CDM version. Press [OK] to continue installing the new LG CDM without restoring database.

- i. Find VersionMismatchException log from LG CDM installer.log (See the figure below)
- Default LG CDM installation directory: C:\Program Files\LG CDM
- Find from=<DB Backup File Version> to=<New LG CDM Installer Version>. See the Installer Update Support Table above.

```

```

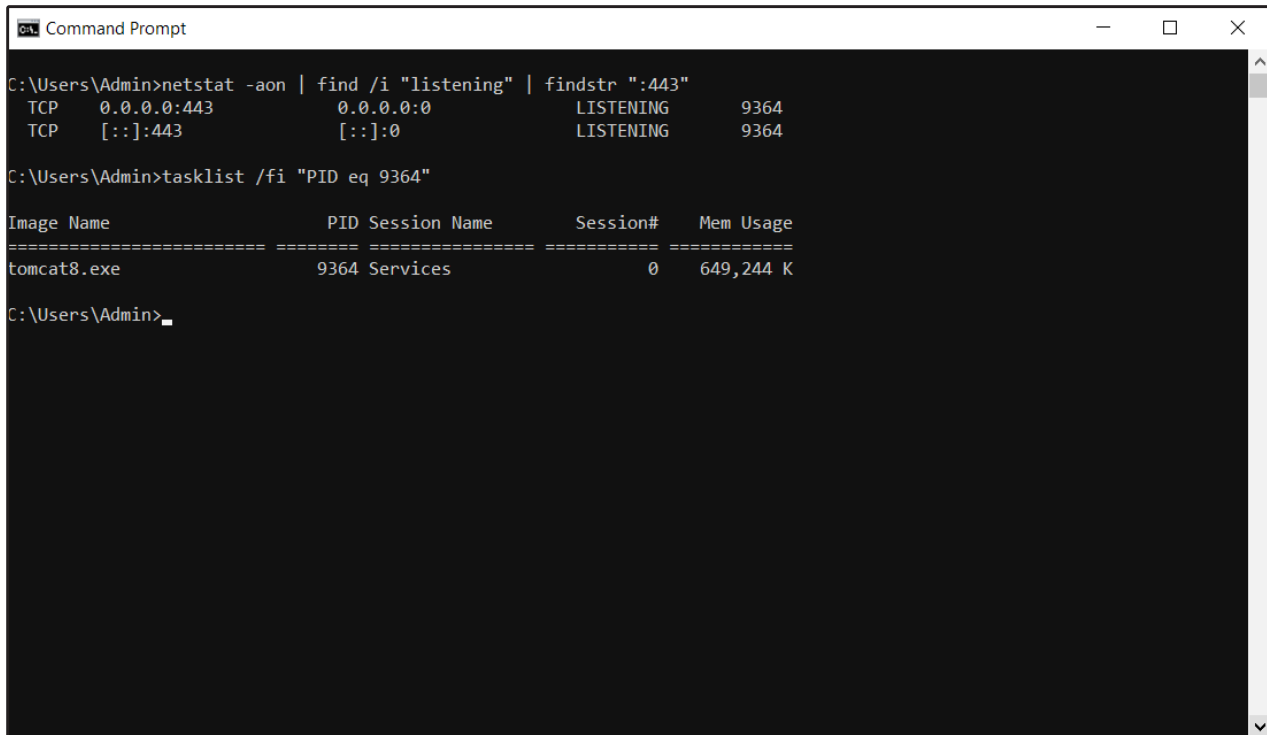

4. Installer couldn't confirm either port 443 or 5672 are listening.

This is simply a warning prompt, suggesting that LG CDM installer executable cannot confirm the server machine's port 443 and port 5672 is open and/or listening. Port 443 is required by Apache-Tomcat service for https connection while port 5672 is used by the Message Broker to establish communication channel between the server (LG CDM) and the end-point devices. Click [OK] to proceed installation.

Optionally, you may use following command to see if the ports are being listened by the appropriate processes:

```
netstat -aon | find /i "listening" | findstr ":443"  
tasklist /fi "PID eq <PID>"
```

Upper command checks ID of which process that's listening port 443. Insert Process ID in <PID> in lower command to check if the ID belongs to tomcat process. (See the figure below)

```
C:\Users\Admin>netstat -aon | find /i "listening" | findstr ":443"  
TCP    0.0.0.0:443      0.0.0.0:0        LISTENING      9364  
TCP    [::]:443        [::]:0           LISTENING      9364  
  
C:\Users\Admin>tasklist /fi "PID eq 9364"  
  
Image Name                PID Session Name        Session#    Mem Usage  
-----  
tomcat8.exe                9364 Services            0           649,244 K  
  
C:\Users\Admin>
```
